### Description

The PI5A3157 is a high-bandwidth, fast single-pole double-throw (SPDT) CMOS switch. It can be used as an analog switch or as a low-delay bus switch. Specified over a wide operating power supply voltage range, 1.65V to 5.5V, the PI5A3157 has a maximum ON resistance of 12-ohms at 1.65V, 9-ohms at 2.3V & 6-ohms at 4.5V.

Break-before-make switching prevents both switches being enabled simultaneously. This eliminates signal disruption during switching. The control input, S, tolerates input drive signals up to 5.5V, independent of supply voltage.

PI5A3157 is an improved direct replacement for the NC7SB3157.

### Applications

- Cell Phones
- PDAs
- Portable Instrumentation
- Battery Powered Communications

**Notes:**

- Measured by voltage drop between A and B pins at the indicated current through the device. On-Resistance is determined by the lower of the voltages on two ports (A or B).
- Parameter is characterized but not tested in production.
- $\Delta R_{ON} = R_{ON \text{ max}} - R_{ON \text{ min}}$ , measured at identical  $V_{DD}$ , temperature and voltage levels.
- Flatness is defined as difference between maximum and minimum value of On-Resistance over the specified range of conditions.
- Guaranteed by design.
