SN8P2308 USER'S MANUAL Specification Version 1.2

SONIX 8-Bit Micro-Controller

SONIX reserves the right to make change without further notice to any products herein to improve reliability, function or design. SONIX does not assume any liability arising out of the application or use of any product or circuit described herein; neither does it convey any license under its patent rights nor the rights of others. SONIX products are not designed, intended, or authorized for us as components in systems intended, for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SONIX product could create a situation where personal injury or death may occur. Should Buyer purchase or use SONIX products for any such unintended or unauthorized application. Buyer shall indemnify and hold SONIX and its officers, employees, subsidiaries, affiliates and distributors harmless against all claims, cost, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use even if such claim alleges that SONIX was negligent regarding the design or manufacture of the part.

AMENDMENT HISTORY

15867339858

Version	Date	Description
VER 0.1	Jan. 2005	First issue.
VER 0.2	Jan. 2005	Modify RFC, LCD and T1 timer descriptions.
		2. Add development tool chapter.
VER 0.3	Jan. 2005	Add RFC to feature selections table.
		2. TCL doesn't support "CLR" instruction. Modify T1 and RFC description about T1CL
		clearing. 3. Modify P.106 T0ENB, T0IRQ, T0IEN to FT0ENB, FT0IRQ, FT0IEN.
		4. Fcpu of slow mode is Flosc/1.
		5. Add RFC first pulse width measurement example.
		6. Modify P1W register of system register table to write only.
		7. Correct P.96 typing error: Change "PCH" to "T1CH" and "PCL" to "T1CL" in Note.
		8. Change part number to SN8P2308Q and SN8P2308QD in electrical characteristic
		chapter.
		Modify supply current values of electrical characteristic table.
VER 0.4	Mar. 2005	1. Modify Z flag description.
		2. Correct the LCDENB bit definition. Set "0" to disable LCD driver.
		3. LCD driver In C type mode only support 1/3 bias LCD panel.
		4. In SN8P2308 EV KIT section:
		a. Add RFC circuit schematic description
		b. Add more description about LCD emulation
VER 1.0	May 2005	1. Modify P121 "COM0~COM4" to "COM0~COM3".
		2. Modify P77 TC0X8.
		3. Modify P11 \ P70 : After power on or reset, P3 default state as input LOW.
		4. ADD BROWN-OUT circuit.
VER 1.1	Dec. 2005	1. Modify Topr value.
		2. Modify Brown-Out Reset description
		3. Remove High clock 32K mode.
		4. Modify M2IDE 1.07
		5. Add T0 RTC description
		6. Remove power consumption(Pc)
		7. Add Fcpu limitation by Noise filter enable.
		8. Modify ELECTRICAL CHARACTERISTIC.
VER 1.2	Jan. 2007	1. Add Marking Definition.
		2. Modify ELECTRICAL CHARACTERISTIC.
		3. Modify RFC register to RFCM.

1 PRODUCT OVERVIEW

1.1 FEATURES

♦ Memory configuration

OTP ROM size: 4K * 16 bits. RAM size: 128 * 8 bits.

8 levels stack buffer.

I/O pin configuration

Bi-directional: P0, P1, P5.

Bi-directional and shared with SEG pins: P3.

Input only: P0.2 shared with reset pin.

Wakeup: P0, P1 level change. Pull-up resisters: P0, P1, P3, P5 External interrupt trigger edge: P0.0 controlled by PEDGE.

Event counter input:

P0.0 is TC0 event counter input. P0.1 is T1 event counter input.

RFC shared pins:

RFC0 (P5.0): RFC channel 0 input pin. RFC1 (P5.1): RFC channel 1 input pin. RFC2 (P5.2): RFC channel 2 input pin. RFCI (P5.3): RFC feedback input pin. RFCOUT (P5.5): RFC output pin.

♦ 3-Level LVD

For system reset or brief VDD indicator.

♦ Powerful instructions

Instruction cycle controlled by code option.
Instruction's length is one word.
Most of instructions are one cycle only.
Maximum instruction cycle is two.
All ROM area JMP and CALL instruction.
All ROM area CALL address instruction.
All ROM area lookup table function (MOVC)

• 4*32 LCD Driver (128 dots)

Support C type or R type bias

♦ RFC (Resistor to Frequency Converter)

For 2-channel RC type AD converter

♦ Four interrupt sources

Three internal interrupts: T0, TC0, T1. One external interrupts: INT0.

♦ Two 8-bit Timer/Counter

T0: Basic timer.

TC0: Auto-reload timer/counter/PWM0/Buzzer output.

♦ One 16-bit timer counters.

T1: Timer/counter/RFC measurement and output.

♦ On chip watchdog timer and clock source is internal low clock RC type (16KHz @3V, 32KHz @5V).

♦ Dual system clocks

External high clock: RC type up to 10MHz. External high clock: Crystal type up to 16MHz. External low clock: 32KHz crystal/RC type

♦ Four operation modes

Normal mode: Both high and low clock active. Slow mode: 32KHz low clock active.

Sleep mode: Both high and low clock stop. Green mode: Periodical wake-up by T0 timer.

♦ Package (Chip form support)

LQFP 64 pins.

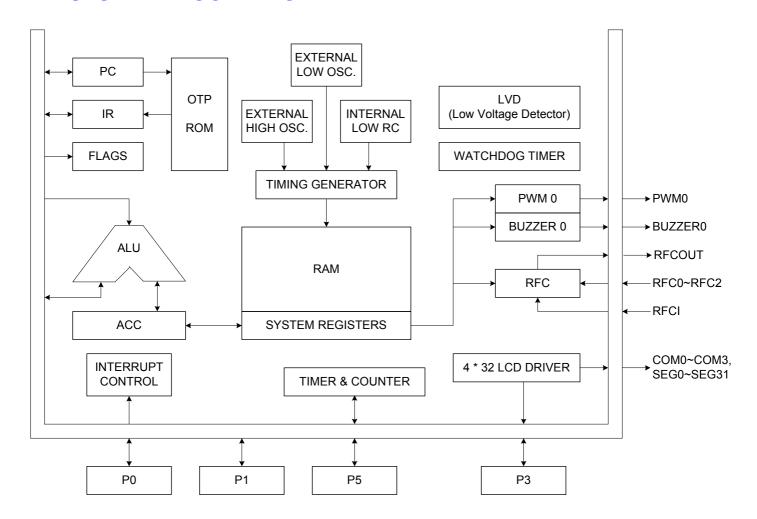

Features Selection Table

1.4 PIN DESCRIPTIONS

15867339858

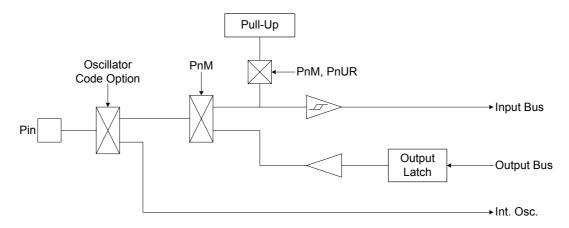

1.4 FIN DESCR					
PIN NAME	TYPE	DESCRIPTION			
VDD, VSS	Р	Power supply input pins for digital circuit.			
VDD1	Р	Connect to VDD when P3.0~P3.7 I/O enable.			
		Connect to VLCD when SEG24~SEG31 enable.			
VLCD	Р	LCD power supply			
V1, V2	Р	LVD bias voltage			
·	'	In LCD R type mode: Connect the external resistors to adjust VLCD voltage.			
C1, C2	ı	Connect the capacitors for internal VLCD charge-pump.			
		P0.2: Input only pin (Schmitt trigger) if disable external reset function.			
		P0.2 without build-in pull-up resister			
RST/VPP/P0.2	I, P	Built- in wake-up function.			
	,	RST: System reset input pin. Schmitt trigger structure, low active, normal operation must stay to "high".			
		VPP: OTP programming pin.			
XIN	1	Oscillator input pin while external oscillator enable (crystal and RC).			
XIIV	- '	Port 0.3 bi-direction pin. Schmitt trigger structure as input mode.			
		Built-in pull-up resistor.			
XOUT/P0.3	I/O	Built- in wake-up function.			
		XOUT: Oscillator output pin while external crystal enable.			
LXIN	ı	External low oscillator input pin (32768Hz crystal or RC).			
LXOUT	0	External low oscillator output pin.			
2/1001		Port 0.0 bi-direction pin. Schmitt trigger structure as input mode.			
		Built-in pull-up resisters.			
P0.0/INT0	I/O	Built- in wake-up function.			
		INT0 trigger pin (Schmitt trigger).			
		TC0 event counter clock input pin.			
		Port 0.1 bi-direction pin. Schmitt trigger structure as input mode.			
DO 4/T4IN	1/0	Built-in pull-up resisters.			
P0.1/T1IN	I/O	Built- in wake-up function.			
		T1 event counter clock input pin.			
		Port 1 bi-direction pin. Schmitt trigger structure as input mode.			
P1 [6:0]	I/O	Built-in pull-up resisters.			
		Built- in wake-up function.			
		Port 3 bi-direction pin in P3SEG=1. Schmitt trigger structure as input mode.			
P3 [7:0]	I/O	Built-in pull-up resisters.			
	-	After power on or reset,P3 default state as input LOW.			
D= 0/ D=00	.,,	Port 5.0 bi-direction pin. Schmitt trigger structure as input mode.			
P5.0/ RFC0	I/O	Built-in pull-up resisters.			
	1	RFC0 is RFC channel 0 input pin.			
DE 4/DEC4	1/0	Port 5.1 bi-direction pin. Schmitt trigger structure as input mode.			
P5.1/RFC1	I/O	Built-in pull-up resisters.			
-	-	RFC1 is RFC channel 1 input pin.			
D5 2/DEC2	I/O	Port 5.2 bi-direction pin. Schmitt trigger structure as input mode. Built-in pull-up resisters.			
P5.2/RFC2	1/0	RFC2 is RFC channel 2 input pin.			
	1	Port 5.3 bi-direction pin. Schmitt trigger structure as input mode.			
P5.3/RFCI	I/O	Built-in pull-up resisters.			
1 3.3/10 01	"	RFCI is RFC feedback input pin.			
		Port 5.4 bi-direction pin. Schmitt trigger structure as input mode.			
P5.4/BZ0/PWM0	I/O	Built-in pull-up resisters.			
1 O. TI DEO/1 VVIVIO	"	TC1 ÷ 2 signal output pin for buzzer or PWM output pin.			
		Bi-direction pin. Schmitt trigger structure as input mode.			
P5.5/RFCOUT	I/O	Built-in pull-up resisters.			
. 5.5 5.5.	"	RFCOUT is RFC output pin.			
COM0~COM3	0	LCD driver's COM pin			
SEG0~SEG31	0	LCD driver's SEG pin			
0_00		···

2.1.1.1 RESET VECTOR (0000H)

15867339858

A one-word vector address area is used to execute system reset.

- Power On Reset (NT0=1, NPD=0).
- Watchdog Reset (NT0=0, NPD=0).
- External Reset (NT0=1, NPD=1).

After power on reset, external reset or watchdog timer overflow reset, then the chip will restart the program from address 0000h and all system registers will be set as default values. It is easy to know reset status from NT0, NPD flags of PFLAG register. The following example shows the way to define the reset vector in the program memory.

Example: Defining Reset Vector

ORG 0 ; 0000H

JMP START ; Jump to user program address.

. . .

ORG 10H

START: ; 0010H, The head of user program.

.. ; User program

...

ENDP ; End of program

2.1.1.2 **INTERRUPT VECTOR (0008H)**

15867339858

A 1-word vector address area is used to execute interrupt request. If any interrupt service executes, the program counter (PC) value is stored in stack buffer and jump to 0008h of program memory to execute the vectored interrupt. Users have to define the interrupt vector. The following example shows the way to define the interrupt vector in the program memory.

Note: "PUSH", "POP" instructions save and load ACC/PFLAG without (NT0, NPD). PUSH/POP buffer is a unique buffer and only one level.

> Example: Defining Interrupt Vector. The interrupt service routine is following ORG 8.

.CODE

ORG 0 ; 0000H

JMP START ; Jump to user program address.

• • •

ORG 8 ; Interrupt vector.

PUSH ; Save ACC and PFLAG register to buffers.

•••

POP ; Load ACC and PFLAG register from buffers.

RETI ; End of interrupt service routine

START: ; The head of user program.

.. ; User program

JMP START ; End of user program

. . .

ENDP ; End of program

 \succ Example: Defining Interrupt Vector. The interrupt service routine is following use 150 and 339858

.CODE

ORG 0 ; 0000H

JMP START ; Jump to user program address.

ORG 8 ; Interrupt vector.

JMP MY_IRQ ; 0008H, Jump to interrupt service routine address.

ORG 10H

START: ; 0010H, The head of user program.

; User program.

...

JMP START ; End of user program.

MY_IRQ: ;The head of interrupt service routine.

PUSH ; Save ACC and PFLAG register to buffers.

...

POP ; Load ACC and PFLAG register from buffers.

RETI ; End of interrupt service routine.

ENDP ; End of program.

- * Note: It is easy to understand the rules of SONIX program from demo programs given above. These points are as following:
 - 1. The address 0000H is a "JMP" instruction to make the program starts from the beginning.
 - 2. The address 0008H is interrupt vector.
 - 3. User's program is a loop routine for main purpose application.

LOOK-UP TABLE DESCRIPTION

15867339858

In the ROM's data lookup function, Y register is pointed to middle byte address (bit 8~bit 15) and Z register is pointed to low byte address (bit 0~bit 7) of ROM. After MOVC instruction executed, the low-byte data will be stored in ACC and high-byte data stored in R register.

Example: To look up the ROM data located "TABLE1".

B0MOV Y, #TABLE1\$M : To set lookup table1's middle address **B0MOV** Z. #TABLE1\$L ; To set lookup table1's low address. **MOVC** ; To lookup data, R = 00H, ACC = 35H

; Increment the index address for next address.

INCMS Ζ ; Z+1 ; Z is not overflow. **JMP** @F

INCMS ; Z overflow (FFH \rightarrow 00), \rightarrow Y=Y+1

NOP

MOVC ; To lookup data, R = 51H, ACC = 05H. @@:

TABLE1: DW 0035H ; To define a word (16 bits) data.

> DW 5105H DW 2012H

Note: The Y register will not increase automatically when Z register crosses boundary from 0xFF to 0x00. Therefore, user must take care such situation to avoid look-up table errors. If Z register overflows, Y register must be added one. The following INC_YZ macro shows a simple method to process Y and Z registers automatically.

Example: INC_YZ macro.

INC_YZ **MACRO INCMS** Ζ : Z+1

> **JMP** ; Not overflow @F

INCMS : Y+1

NOP : Not overflow

@@:

ENDM

@@:

GETDATA:

Example: Modify above example by "INC_YZ" macro.

15867339858

 $\begin{array}{lll} B0MOV & Y, \#TABLE1\$M & ; To set lookup table1's middle address \\ B0MOV & Z, \#TABLE1\$L & ; To set lookup table1's low address. \\ MOVC & ; To lookup data, R = 00H, ACC = 35H \end{array}$

INC_YZ ; Increment the index address for next address.

MOVC ; To lookup data, R = 51H, ACC = 05H.

TABLE1: DW 0035H ; To define a word (16 bits) data.

DW 5105H DW 2012H

...

The other example of look-up table is to add Y or Z index register by accumulator. Please be careful if "carry" happen.

Example: Increase Y and Z register by B0ADD/ADD instruction.

B0MOV Y, #TABLE1\$M ; To set lookup table's middle address. B0MOV Z, #TABLE1\$L ; To set lookup table's low address.

B0MOV A, BUF ; Z = Z + BUF. B0ADD Z, A

B0BTS1 FC ; Check the carry flag.

 $\begin{array}{lll} \mbox{JMP} & \mbox{GETDATA} & \mbox{; FC = 0} \\ \mbox{INCMS} & \mbox{Y} & \mbox{; FC = 1. Y+1.} \\ \end{array}$

NOP

MOVC ; To lookup data. If BUF = 0, data is 0x0035

; If BUF = 1, data is 0x5105 ; If BUF = 2, data is 0x2012

2.1.1.4 JUMP TABLE DESCRIPTION

15867339858

The jump table operation is one of multi-address jumping function. Add low-byte program counter (PCL) and ACC value to get one new PCL. If PCL is overflow after PCL+ACC, PCH adds one automatically. The new program counter (PC) points to a series jump instructions as a listing table. It is easy to make a multi-jump program depends on the value of the accumulator (A).

Note: PCH only support PC up counting result and doesn't support PC down counting. When PCL is carry after PCL+ACC, PCH adds one automatically. If PCL borrow after PCL-ACC, PCH keeps value and not change.

> Example: Jump table.

ORG 0X0100 ; The jump table is from the head of the ROM boundary **B0ADD** PCL, A ; PCL = PCL + ACC, PCH + 1 when PCL overflow occurs. JMP **A0POINT** ; ACC = 0, jump to A0POINT **JMP** ; ACC = 1, jump to A1POINT A1POINT **JMP** ; ACC = 2, jump to A2POINT A2POINT **JMP** A3POINT ; ACC = 3, jump to A3POINT

SONIX provides a macro for safe jump table function. This macro will check the ROM boundary and move the jump table to the right position automatically. The side effect of this macro maybe wastes some ROM size.

Example: If "jump table" crosses over ROM boundary will cause errors.

```
@JMP_A MACRO VAL
IF (($+1)!& 0XFF00)!!= (($+(VAL))!& 0XFF00)
JMP ($|0XFF)
ORG ($|0XFF)
ENDIF
ADD PCL, A
ENDM
```

Note: "VAL" is the number of the jump table listing number.

Example: "@JMP_A" application in SONIX macro file called "MACRO3.H".

15867339858

B0MOV	A, BUF0	; "BUF0" is from 0 to 4.
@JMP_A	5	; The number of the jump table listing is five.
JMP	A0POINT	; ACC = 0, jump to A0POINT
JMP	A1POINT	; ACC = 1, jump to A1POINT
JMP	A2POINT	; ACC = 2, jump to A2POINT
JMP	A3POINT	; ACC = 3, jump to A3POINT
JMP	A4POINT	; ACC = 4, jump to A4POINT

If the jump table position is across a ROM boundary (0x00FF \sim 0x0100), the "@JMP_A" macro will adjust the jump table routine begin from next RAM boundary (0x0100).

Example: "@JMP_A" operation.

; Before compiling program.

ROM	address	
-----	---------	--

	B0MOV	A, BUF0 5	; "BUF0" is from 0 to 4. ; The number of the jump table listing is five.
	@JMP_A	ວ	
0X00FD	JMP	A0POINT	; ACC = 0, jump to A0POINT
0X00FE	JMP	A1POINT	; ACC = 1, jump to A1POINT

0X0100	JMP	A3POINT	; ACC = 3, jump to A3POINT
0X0101	JMP	A4POINT	; ACC = 4, jump to A4POINT

; After compiling program.

ROM address

	B0MOV	A, BUF0	; "BUF0" is from 0 to 4.
	@JMP_A	5	; The number of the jump table listing is five.
0X0100	JMP	A0POINT	; ACC = 0, jump to A0POINT
0X0101	JMP	A1POINT	; ACC = 1, jump to A1POINT
0X0102	JMP	A2POINT	; ACC = 2, jump to A2POINT
0X0103	JMP	A3POINT	; ACC = 3, jump to A3POINT
0X0104	JMP	A4POINT	; ACC = 4, jump to A4POINT

2.1.1.5 CHECKSUM CALCULATION

15867339858

The last ROM address are reserved area. User should avoid these addresses (last address) when calculate the Checksum value.

Example: The demo program shows how to calculated Checksum from 00H to the end of user's code.

	MOV B0MOV MOV B0MOV CLR CLR	A,#END_USER_CODE\$L END_ADDR1, A A,#END_USER_CODE\$M END_ADDR2, A Y Z	; Save low end address to end_addr1 ; Save middle end address to end_addr2 ; Set Y to 00H ; Set Z to 00H
@@: AAA:	MOVC B0BSET ADD MOV ADC JMP	FC DATA1, A A, R DATA2, A END_CHECK	; Clear C flag ; Add A to Data1 ; Add R to Data2 ; Check if the YZ address = the end of code
END CHECK:	INCMS JMP JMP	Z @B Y_ADD_1	; Z=Z+1 ; If Z != 00H calculate to next address ; If Z = 00H increase Y
END_CHECK.	MOV CMPRS JMP MOV CMPRS JMP JMP	A, END_ADDR1 A, Z AAA A, END_ADDR2 A, Y AAA CHECKSUM_END	; Check if Z = low end address ; If Not jump to checksum calculate ; If Yes, check if Y = middle end address ; If Not jump to checksum calculate ; If Yes checksum calculated is done.
Y_ADD_1:	INCMS NOP	Υ	; Increase Y
CHECKSUM_END:	JMP	@B	; Jump to checksum calculate
END_USER_CODE:			; Label of program end

2.1.3 DATA MEMORY (RAM)

15867339858

9 128 X 8-bit RAM

	Address	RAM location	
DANK 0	000h " " " 07Fh	General purpose area	
BANK 0	080h " " "	System register	080h~0FFh of Bank 0 store system registers (128 bytes).
	0FFh	End of bank 0 area	
BANK 15	000h " " 01Fh	LCD RAM area	0x00~0x1F of Bank 15 (32 byte) is LCD RAM registers.

2.1.2 CODE OPTION TABLE

15867339858

Code Option	Content	Function Description					
	RC	Low cost RC for external high clock oscillator and XOUT becomes to P1.2 bit-direction I/O pin.					
High_Clk	12M X'tal	High speed crystal /resonator (e.g. 12MHz) for external high clock oscillator.					
	4M X'tal	Standard crystal /resonator (e.g. 4M) for external high clock oscillator.					
	Always_On	Watchdog timer is always on enable even in power down and green mode.					
Watch_Dog	Enable	Enable watchdog timer. Watchdog timer stops in power down mode and green mode.					
	Disable	Disable Watchdog function.					
	Fhosc/1	Instruction cycle is oscillator clock. Notice: In Fosc/1, Noise Filter must be disabled.					
Fcpu	Fhosc/2	Instruction cycle is 2 oscillator clocks. Notice: In Fosc/2, Noise Filter must be disabled.					
	Fhosc/4	Instruction cycle is 4 oscillator clocks.					
	Fhosc/8	Instruction cycle is 8 oscillator clocks.					
Reset Pin	Reset	Enable External reset pin.					
Keset_Fiii	P02	Enable P0.2 input only without pull-up resister.					
Security	Enable	Enable ROM code Security function.					
Security	Disable	Disable ROM code Security function.					
Noise_Filter	Enable	Enable Noise Filter and the Fcpu is Fosc/4~Fosc/8.					
Noise_i iitei	Disable	Disable Noise Filter and the Fcpu is Fosc/1~Fosc/8.					
	LVD_L	LVD will reset chip if VDD is below 2.0V					
LVD	LVD_M	LVD will reset chip if VDD is below 2.0V Enable LVD24 bit of PFLAG register for 2.4V low voltage indicator.					
	LVD_H	LVD will reset chip if VDD is below 2.4V Enable LVD36 bit of PFLAG register for 3.6V low voltage indicator.					

* Note:

- 1. In high noisy environment, enable "Noise Filter" and set Watch_Dog as "Always_On" is strongly recommended. Enable "Noise_Filter" will limit the Fcpu = Fosc/4 ~ Fosc/128.
- 2. In high noisy environment, enable "Noise Filter" and set Watch_Dog as "Always_On" is strongly recommended.
- 3. Fcpu code option is only available for High Clock. Fcpu of slow mode is Flosc/4.

2.1.4 SYSTEM REGISTER

2.1.4.2 SYSTEM REGISTER DESCRIPTION

R = Working register and ROM look-up data buffer.

PFLAG = ROM page and special flag register.

RBANK = RAM bank control register.

T1M = T1 mode register.

RFCM = RFC mode register.

PnM = Port n input/output mode register.

INTRQ = Interrupt request register.

OSCM = Oscillator mode register.

TC0R = TC0 auto-reload data buffer.

Pn = Port n data buffer.

TC0M = TC0 mode register.

T0C = T0 counting register.

PnUR = Port n pull-up resister control register.

STK0~STK7 = Stack 0 ~ stack 7 buffer.

Y, Z = Working, @YZ and ROM addressing register.

H, L = Working, @HL addressing register.

VLCD = LCD voltage control register.

T1CH, T1CL = T1 counting register.

PEDGE = P0.0 edge direction register.

P1W = P1 wakeup control register.

INTEN = Interrupt enable register.

LCDM = LCD mode register.

WDTR = Watchdog timer clear register.

PCH, PCL = Program counter.

T0M = TC0/TC1 speed-up and TC0 wake-up function register.

TC0C = TC0 counting register.

STKP = Stack pointer buffer.

@HL = RAM HL indirect addressing index pointer.

@YZ = RAM YZ indirect addressing index pointer.

2.1.4.3 BIT DEFINITION of SYSTEM REGISTER

2.1.5.3 ACCUMULATOR

15867339858

The ACC is an 8-bit data register responsible for transferring or manipulating data between ALU and data memory. If the result of operating is zero (Z) or there is carry (C or DC) occurrence, then these flags will be set to PFLAG register. ACC is not in data memory (RAM), so ACC can't be access by "B0MOV" instruction during the instant addressing mode.

Example: Read and write ACC va	lue.
--------------------------------	------

; Read ACC data and store in BUF data memory.

MOV BUF, A

; Write a immediate data into ACC.

MOV A, #0FH

; Write ACC data from BUF data memory.

MOV A, BUF

; or

B0MOV A, BUF

The system doesn't store ACC and PFLAG value when interrupt executed. ACC and PFLAG data must be saved to other data memories. "PUSH", "POP" save and load ACC, PFLAG data into buffers.

Example: Protect ACC and working registers.

INT_SERVICE:

PUSH ; Save ACC and PFLAG to buffers.

.. .

POP ; Load ACC and PFLAG from buffers.

RETI ; Exit interrupt service vector

2.1.5.4 PROGRAM FLAG

15867339858

The PFLAG register contains the arithmetic status of ALU operation, system reset status and LVD detecting status. NT0, NPD bits indicate system reset status including power on reset, LVD reset, reset by external pin active and watchdog reset. C, DC, Z bits indicate the result status of ALU operation. LVD24, LVD36 bits indicate LVD detecting power voltage status.

086H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PFLAG	NT0	NPD	LVD36	LVD24	-	C	DC	Z
Read/Write	R/W	R/W	R	R	-	R/W	R/W	R/W
After reset	ı	-	0	0	-	0	0	0

Bit [7:6] NT0, NPD: Reset status flag.

NT0	NPD	Reset Status
0	0	Watch-dog time out
0	1	Reserved
1	0	Reset by LVD
1	1	Reset by external Reset Pin

Bit 5 LVD36: LVD 3.6V operating flag and only support LVD code option is LVD_H.

0 = Inactive (VDD > 3.6V).

1 = Active (VDD <= 3.6V).

Bit 4 LVD24: LVD 2.4V operating flag and only support LVD code option is LVD M.

0 = Inactive (VDD > 2.4V).

 $1 = Active (VDD \le 2.4V).$

Bit 2 C: Carry flag

- 1 = Addition with carry, subtraction without borrowing, rotation with shifting out logic "1", comparison result ≥ 0
- 0 = Addition without carry, subtraction with borrowing signal, rotation with shifting out logic "0", comparison result < 0.

Bit 1 DC: Decimal carry flag

- 1 = Addition with carry from low nibble, subtraction without borrow from high nibble.
- 0 = Addition without carry from low nibble, subtraction with borrow from high nibble.

Bit 0 **Z**: Zero flag

- 1 = The result of an arithmetic/logic/branch operation is zero.
- 0 = The result of an arithmetic/logic/branch operation is not zero.
- Note: Refer to instruction set table for detailed information of C, DC and Z flags.

2.1.5.5 PROGRAM COUNTER

15867339858

The program counter (PC) is a 12-bit binary counter separated into the high-byte 4 and the low-byte 8 bits. This counter is responsible for pointing a location in order to fetch an instruction for kernel circuit. Normally, the program counter is automatically incremented with each instruction during program execution.

Besides, it can be replaced with specific address by executing CALL or JMP instruction. When JMP or CALL instruction is executed, the destination address will be inserted to bit 0 ~ bit 11.

	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PC	-	-	-	-	PC11	PC10	PC9	PC8	PC7	PC6	PC5	PC4	PC3	PC2	PC1	PC0
After reset	-	1	-	ı	0	0	0	0	0	0	0	0	0	0	0	0
	PCH											P(CL			

ONE ADDRESS SKIPPING

There are nine instructions (CMPRS, INCS, INCMS, DECS, DECMS, BTS0, BTS1, B0BTS0, B0BTS1) with one address skipping function. If the result of these instructions is true, the PC will add 2 steps to skip next instruction.

If the condition of bit test instruction is true, the PC will add 2 steps to skip next instruction.

B0BTS1 FC ; To skip, if Carry_flag = 1 JMP C0STEP ; Else jump to C0STEP.

...

COSTEP: NOP

B0MOV A, BUF0 ; Move BUF0 value to ACC. **B0BTS0** FZ ; To skip, if Zero flag = 0.

JMP C1STEP ; Else jump to C1STEP.

. . .

C1STEP: NOP

If the ACC is equal to the immediate data or memory, the PC will add 2 steps to skip next instruction.

CMPRS A, #12H ; To skip, if ACC = 12H.

JMP COSTEP ; Else jump to COSTEP.

• • •

COSTEP: NOP

If the destination increased by 1, which results overflow of 0xFF to 0x00, the PC will apply the post instruction.

INCS instruction:

INCS BUF0

JMP COSTEP ; Jump to COSTEP if ACC is not zero.

• • •

COSTEP: NOP

INCMS instruction:

INCMS BUF0

JMP COSTEP ; Jump to COSTEP if BUF0 is not zero.

٠..

COSTEP: NOP

If the destination decreased by 1, which results underflow of 0x00 to 0xFF, the PC will add 2 steps to skip next instruction.

DECS instruction:

DECS BUF0

JMP COSTEP ; Jump to COSTEP if ACC is not zero.

• • •

COSTEP: NOP

DECMS instruction:

DECMS BUF0

JMP COSTEP ; Jump to COSTEP if BUF0 is not zero.

• • •

COSTEP: NOP

MULTI-ADDRESS JUMPING

15867339858

Users can jump around the multi-address by either JMP instruction or ADD M, A instruction (M = PCL) to activate multi-address jumping function. Program Counter supports "ADD M,A", "ADC M,A" and "B0ADD M,A" instructions for carry to PCH when PCL overflow automatically. For jump table or others applications, users can calculate PC value by the three instructions and don't care PCL overflow problem.

Note: PCH only support PC up counting result and doesn't support PC down counting. When PCL is carry after PCL+ACC, PCH adds one automatically. If PCL borrow after PCL-ACC, PCH keeps value and not change.

> Example: If PC = 0323H (PCH = 03H, PCL = 23H)

; PC = 0323H

MOV A, #28H

B0MOV PCL, A ; Jump to address 0328H

. . .

; PC = 0328H

MOV A, #00H

B0MOV PCL, A ; Jump to address 0300H

...

> Example: If PC = 0323H (PCH = 03H, PCL = 23H)

; PC = 0323H

BOADD PCL, A ; PCL = PCL + ACC, the PCH cannot be changed.

JMPA0POINT; If ACC = 0, jump to A0POINTJMPA1POINT; ACC = 1, jump to A1POINTJMPA2POINT; ACC = 2, jump to A2POINTJMPA3POINT; ACC = 3, jump to A3POINT

...

15867339858

2.1.5.6 H, L REGISTERS

The H and L registers are the 8-bit buffers. There are two major functions of these registers.

- can be used as general working registers
- can be used as RAM data pointers with @HL register

081H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Н	HBIT7	HBIT6	HBIT5	HBIT4	HBIT3	HBIT2	HBIT1	HBIT0
Read/Write	R/W							
After reset	X	X	Χ	Χ	Х	Х	X	Х

080H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
L	LBIT7	LBIT6	LBIT5	LBIT4	LBIT3	LBIT2	LBIT1	LBIT0
Read/Write	R/W							
After reset	Х	Х	Х	Х	Х	Х	Х	X

Example: If want to read a data from RAM address 20H of bank_0, it can use indirectly addressing mode to access data as following.

B0MOV H, #00H ; To set RAM bank 0 for H register B0MOV L, #20H ; To set location 20H for L register

B0MOV A, @HL ; To read a data into ACC

> Example: Clear general-purpose data memory area of bank 0 using @HL register.

CLR H ; H = 0, bank 0

B0MOV L, #07FH ; L = 7FH, the last address of the data memory area

CLR_HL_BUF:

CLR @HL ; Clear @HL to be zero

DECMS L ; L - 1, if L = 0, finish the routine

JMP CLR_HL_BUF ; Not zero

CLR @HL

END_CLR: ; End of clear general purpose data memory area of bank 0

...

2.1.5.7 Y, Z REGISTERS

15867339858

The Y and Z registers are the 8-bit buffers. There are three major functions of these registers.

- can be used as general working registers
- can be used as RAM data pointers with @YZ register
- can be used as ROM data pointer with the MOVC instruction for look-up table

084H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Υ	YBIT7	YBIT6	YBIT5	YBIT4	YBIT3	YBIT2	YBIT1	YBIT0
Read/Write	R/W							
After reset	-	-	-	-	-	-	-	-

083H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Z	ZBIT7	ZBIT6	ZBIT5	ZBIT4	ZBIT3	ZBIT2	ZBIT1	ZBIT0
Read/Write	R/W							
After reset	-	-	-	-	-	-	-	-

Example: Uses Y, Z register as the data pointer to access data in the RAM address 025H of bank0.

 $\begin{array}{lll} {\sf B0MOV} & {\sf Y,\#00H} & ; \ {\sf To\ set\ RAM\ bank\ 0\ for\ Y\ register} \\ {\sf B0MOV} & {\sf Z,\#25H} & ; \ {\sf To\ set\ location\ 25H\ for\ Z\ register} \end{array}$

B0MOV A, @YZ ; To read a data into ACC

> Example: Uses the Y, Z register as data pointer to clear the RAM data.

B0MOV Y, #0 ; Y = 0, bank 0

B0MOV Z, #07FH ; Z = 7FH, the last address of the data memory area

CLR_YZ_BUF:

CLR @YZ ; Clear @YZ to be zero

DECMS Z; Z - 1, if Z = 0, finish the routine

JMP CLR_YZ_BUF ; Not zero

CLR @YZ

END CLR: ; End of clear general purpose data memory area of bank 0

.

2.1.5.8 R REGISTERS

15867339858

R register is an 8-bit buffer. There are two major functions of the register.

- Can be used as working register
- For store high-byte data of look-up table
 (MOVC instruction executed, the high-byte data of specified ROM address will be stored in R register and the low-byte data will be stored in ACC).

082H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
R	RBIT7	RBIT6	RBIT5	RBIT4	RBIT3	RBIT2	RBIT1	RBIT0
Read/Write	R/W							
After reset	-	-	-	-	-	-	-	-

Note: Please refer to the "LOOK-UP TABLE DESCRIPTION" about R register look-up table application.

2.2 ADDRESSING MODE

15867339858

2.2.1 IMMEDIATE ADDRESSING MODE

The immediate addressing mode uses an immediate data to set up the location in ACC or specific RAM.

Example: Move the immediate data 12H to ACC.

MOV A, #12H ; To set an immediate data 12H into ACC.

Example: Move the immediate data 12H to R register.

B0MOV R, #12H ; To set an immediate data 12H into R register.

Note: In immediate addressing mode application, the specific RAM must be 0x80~0x87 working register.

2.2.2 DIRECTLY ADDRESSING MODE

The directly addressing mode moves the content of RAM location in or out of ACC.

> Example: Move 0x12 RAM location data into ACC.

B0MOV A, 12H ; To get a content of RAM location 0x12 of bank 0 and save in

ACC.

Example: Move ACC data into 0x12 RAM location.

B0MOV 12H, A ; To get a content of ACC and save in RAM location 12H of

bank 0.

2.2.3 INDIRECTLY ADDRESSING MODE

The indirectly addressing mode is to access the memory by the data pointer registers (H/L, Y/Z).

Example: Indirectly addressing mode with @HL register

B0MOV H, #0 ; To clear H register to access RAM bank 0. B0MOV L, #12H ; To set an immediate data 12H into L register.

B0MOV A, @HL ; Use data pointer @HL reads a data from RAM location

; 012H into ACC.

Example: Indirectly addressing mode with @YZ register

B0MOV Y, #0 ; To clear Y register to access RAM bank 0. B0MOV Z, #12H ; To set an immediate data 12H into Z register.

B0MOV A, @YZ ; Use data pointer @YZ reads a data from RAM location

; 012H into ACC.

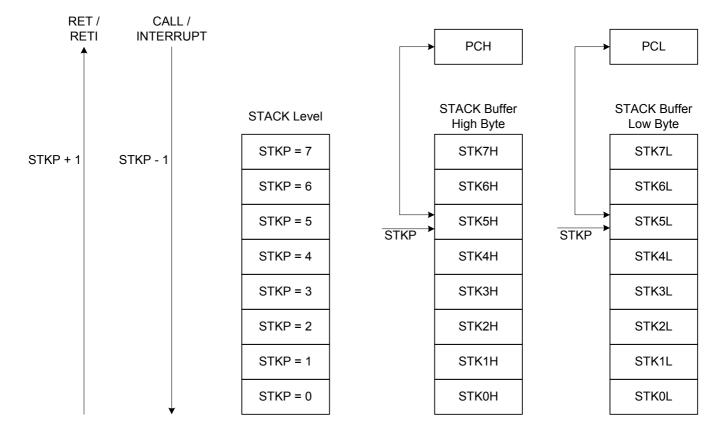

15867339858

2.3 STACK OPERATION

2.3.1 OVERVIEW

The stack buffer has 8-level. These buffers are designed to push and pop up program counter's (PC) data when interrupt service routine and "CALL" instruction are executed. The STKP register is a pointer designed to point active level in order to push or pop up data from stack buffer. The STKnH and STKnL are the stack buffers to store program counter (PC) data.

2.3.2 STACK REGISTERS

15867339858

The stack pointer (STKP) is a 3-bit register to store the address used to access the stack buffer, 12-bit data memory (STKnH and STKnL) set aside for temporary storage of stack addresses.

The two stack operations are writing to the top of the stack (push) and reading from the top of stack (pop). Push operation decrements the STKP and the pop operation increments each time. That makes the STKP always point to the top address of stack buffer and write the last program counter value (PC) into the stack buffer.

The program counter (PC) value is stored in the stack buffer before a CALL instruction executed or during interrupt service routine. Stack operation is a LIFO type (Last in and first out). The stack pointer (STKP) and stack buffer (STKnH and STKnL) are located in the system register area bank 0.

0DFH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
STKP	GIE	-	-	-	-	STKPB2	STKPB1	STKPB0
Read/Write	R/W	-	-	-	-	R/W	R/W	R/W
After reset	0	-	-	-	-	1	1	1

Bit[2:0] **STKPBn:** Stack pointer (n = $0 \sim 2$)

Bit 7 GIE: Global interrupt control bit.

0 = Disable.

1 = Enable. Please refer to the interrupt chapter.

Example: Stack pointer (STKP) reset, we strongly recommended to clear the stack pointer in the beginning of the program.

MOV A, #00000111B B0MOV STKP, A

0F0H~0FFH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
STKnH	-	-	-	-	SnPC11	SnPC10	SnPC9	SnPC8
Read/Write	-	-	-	-	R/W	R/W	R/W	R/W
After reset	ı	1	ı	-	0	0	0	0

0F0H~0FFH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
STKnL	SnPC7	SnPC6	SnPC5	SnPC4	SnPC3	SnPC2	SnPC1	SnPC0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

STKn = STKnH, STKnL $(n = 7 \sim 0)$

2.3.3 STACK OPERATION EXAMPLE

15867339858

The two kinds of Stack-Save operations refer to the stack pointer (STKP) and write the content of program counter (PC) to the stack buffer are CALL instruction and interrupt service. Under each condition, the STKP decreases and points to the next available stack location. The stack buffer stores the program counter about the op-code address. The Stack-Save operation is as the following table.

Stack Level	S	TKP Registe	er	Stack	Buffer	Description
Stack Level	STKPB2	STKPB1	STKPB0	High Byte	Low Byte	Description
0	1	1	1	Free	Free	-
1	1	1	0	STK0H	STK0L	-
2	1	0	1	STK1H	STK1L	-
3	1	0	0	STK2H	STK2L	-
4	0	1	1	STK3H	STK3L	-
5	0	1	0	STK4H	STK4L	-
6	0	0	1	STK5H	STK5L	-
7	0	0	0	STK6H	STK6L	-
8	1	1	1	STK7H	STK7L	-
> 8	1	1	0	-	-	Stack Over, error

There are Stack-Restore operations correspond to each push operation to restore the program counter (PC). The RETI instruction uses for interrupt service routine. The RET instruction is for CALL instruction. When a pop operation occurs, the STKP is incremented and points to the next free stack location. The stack buffer restores the last program counter (PC) to the program counter registers. The Stack-Restore operation is as the following table.

Stack Level	S	STKP Registe	er	Stack	Buffer	Description
Stack Level	STKPB2	STKPB1	STKPB0	High Byte	Low Byte	Description
8	1	1	1	STK7H	STK7L	=
7	0	0	0	STK6H	STK6L	=
6	0	0	1	STK5H	STK5L	-
5	0	1	0	STK4H	STK4L	=
4	0	1	1	STK3H	STK3L	=
3	1	0	0	STK2H	STK2L	-
2	1	0	1	STK1H	STK1L	-
1	1	1	0	STK0H	STK0L	-
0	1	1	1	Free	Free	-

3 RESET

15867339858

3.1 OVERVIEW

The system would be reset in three conditions as following.

- Power on reset
- Watchdog reset
- Brown out reset
- External reset (only supports external reset pin enable situation)

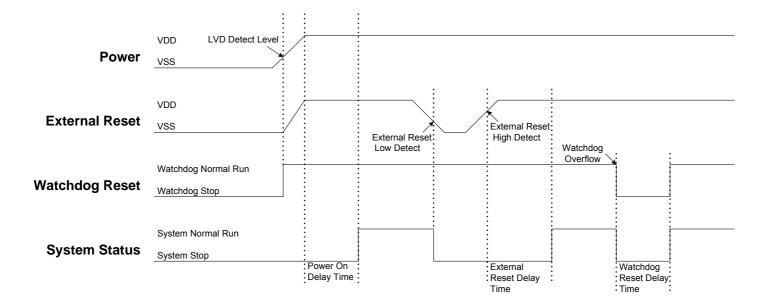

When any reset condition occurs, all system registers keep initial status, program stops and program counter is cleared. After reset status released, the system boots up and program starts to execute from ORG 0. The NT0, NPD flags indicate system reset status. The system can depend on NT0, NPD status and go to different paths by program.

086H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PFLAG	NT0	NPD	LVD36	LVD24	-	С	DC	Z
Read/Write	R/W	R/W	R	R	-	R/W	R/W	R/W
After reset	-	-	0	0	-	0	0	0

Bit [7:6] NT0, NPD: Reset status flag.

NT0	NPD	Condition	Description
0	0	Watchdog reset	Watchdog timer overflow.
0	1	Reserved	-
1	0	Power on reset and LVD reset.	Power voltage is lower than LVD detecting level.
1	1	External reset	External reset pin detect low level status.

Finishing any reset sequence needs some time. The system provides complete procedures to make the power on reset successful. For different oscillator types, the reset time is different. That causes the VDD rise rate and start-up time of different oscillator is not fixed. RC type oscillator's start-up time is very short, but the crystal type is longer. Under client terminal application, users have to take care the power on reset time for the master terminal requirement. The reset timing diagram is as following.

3.2 POWER ON RESET

The power on reset depend no LVD operation for most power-up situations. The power supplying to system is a rising curve and needs some time to achieve the normal voltage. Power on reset sequence is as following.

- Power-up: System detects the power voltage up and waits for power stable.
- External reset (only external reset pin enable): System checks external reset pin status. If external reset pin is not high level, the system keeps reset status and waits external reset pin released.
- System initialization: All system registers is set as initial conditions and system is ready.
- Oscillator warm up: Oscillator operation is successfully and supply to system clock.
- Program executing: Power on sequence is finished and program executes from ORG 0.

3.3 WATCHDOG RESET

Watchdog reset is a system protection. In normal condition, system works well and clears watchdog timer by program. Under error condition, system is in unknown situation and watchdog can't be clear by program before watchdog timer overflow. Watchdog timer overflow occurs and the system is reset. After watchdog reset, the system restarts and returns normal mode. Watchdog reset sequence is as following.

- Watchdog timer status: System checks watchdog timer overflow status. If watchdog timer overflow occurs, the system is reset.
- System initialization: All system registers is set as initial conditions and system is ready.
- Oscillator warm up: Oscillator operation is successfully and supply to system clock.
- Program executing: Power on sequence is finished and program executes from ORG 0.

Watchdog timer application note is as following.

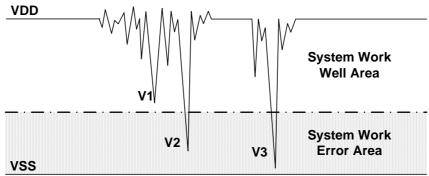

- Before clearing watchdog timer, check I/O status and check RAM contents can improve system error.
- Don't clear watchdog timer in interrupt vector and interrupt service routine. That can improve main routine fail.
- Clearing watchdog timer program is only at one part of the program. This way is the best structure to enhance the watchdog timer function.
- Note: Please refer to the "WATCHDOG TIMER" about watchdog timer detail information.

3.4 BROWN OUT RESET

3.4.1 BROWN OUT DESCRIPTION

The brown out reset is a power dropping condition. The power drops from normal voltage to low voltage by external factors (e.g. EFT interference or external loading changed). The brown out reset would make the system not work well or executing program error.

Brown Out Reset Diagram

The power dropping might through the voltage range that's the system dead-band. The dead-band means the power range can't offer the system minimum operation power requirement. The above diagram is a typical brown out reset diagram. There is a serious noise under the VDD, and VDD voltage drops very deep. There is a dotted line to separate the system working area. The above area is the system work well area. The below area is the system work error area called dead-band. V1 doesn't touch the below area and not effect the system operation. But the V2 and V3 is under the below area and may induce the system error occurrence. Let system under dead-band includes some conditions.

DC application:

The power source of DC application is usually using battery. When low battery condition and MCU drive any loading, the power drops and keeps in dead-band. Under the situation, the power won't drop deeper and not touch the system reset voltage. That makes the system under dead-band.

AC application:

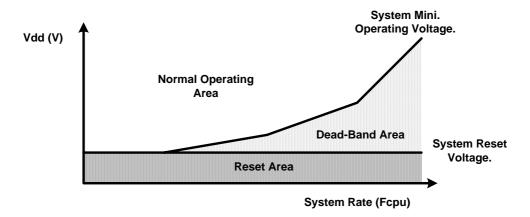

In AC power application, the DC power is regulated from AC power source. This kind of power usually couples with AC noise that makes the DC power dirty. Or the external loading is very heavy, e.g. driving motor. The loading operating induces noise and overlaps with the DC power. VDD drops by the noise, and the system works under unstable power situation.

The power on duration and power down duration are longer in AC application. The system power on sequence protects the power on successful, but the power down situation is like DC low battery condition. When turn off the AC power, the VDD drops slowly and through the dead-band for a while.

3.4.2 THE SYSTEM OPERATING VOLTAGE DECSRIPTION 15867339858

To improve the brown out reset needs to know the system minimum operating voltage which is depend on the system executing rate and power level. Different system executing rates have different system minimum operating voltage. The electrical characteristic section shows the system voltage to executing rate relationship.

Normally the system operation voltage area is higher than the system reset voltage to VDD, and the reset voltage is decided by LVD detect level. The system minimum operating voltage rises when the system executing rate upper even higher than system reset voltage. The dead-band definition is the system minimum operating voltage above the system reset voltage.

3.4.3 BROWN OUT RESET IMPROVEMENT

How to improve the brown reset condition? There are some methods to improve brown out reset as following.

- LVD reset
- Watchdog reset
- Reduce the system executing rate
- External reset circuit. (Zener diode reset circuit, Voltage bias reset circuit, External reset IC)

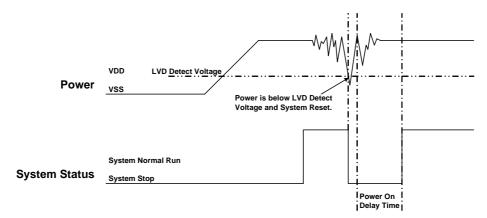

Note:

- 1. The "Zener diode reset circuit", "Voltage bias reset circuit" and "External reset IC" can completely improve the brown out reset, DC low battery and AC slow power down conditions.
- 2. For AC power application and enhance EFT performance, the system clock is 4MHz/4 (1 mips) and use external reset (" Zener diode reset circuit", "Voltage bias reset circuit", "External reset IC"). The structure can improve noise effective and get good EFT characteristic.

LVD reset:

15867339858

The LVD (low voltage detector) is built-in Sonix 8-bit MCU to be brown out reset protection. When the VDD drops and is below LVD detect voltage, the LVD would be triggered, and the system is reset. The LVD detect level is different by each MCU. The LVD voltage level is a point of voltage and not easy to cover all dead-band range. Using LVD to improve brown out reset is depend on application requirement and environment. If the power variation is very deep, violent and trigger the LVD, the LVD can be the protection. If the power variation can touch the LVD detect level and make system work error, the LVD can't be the protection and need to other reset methods. More detail LVD information is in the electrical characteristic section.

The LVD is three levels design (2.0V/2.4V/3.6V) and controlled by LVD code option. The 2.0V LVD is always enable for power on reset and Brown Out reset. The 2.4V LVD includes LVD reset function and flag function to indicate VDD status function. The 3.6V includes flag function to indicate VDD status. LVD flag function can be an **easy low battery detector**. LVD24, LVD36 flags indicate VDD voltage level. For low battery detect application, only checking LVD24, LVD36 status to be battery status. This is a cheap and easy solution.

086H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

After reset	-	1	0	0	-	0	0	0

Bit 5 LVD36: LVD 3.6V operating flag and only support LVD code option is LVD H.

0 = Inactive (VDD > 3.6V).

 $1 = Active (VDD \le 3.6V).$

Bit 4 LVD24: LVD 2.4V operating flag and only support LVD code option is LVD_M.

0 = Inactive (VDD > 2.4V).

 $1 = Active (VDD \le 2.4V).$

<u>158673</u>39858

LVD	LVD Code Option						
	LVD_L	LVD_M	LVD_H				
2.0V Reset	Available	Available	Available				
2.4V Flag	-	Available	-				
2.4V Reset	-	-	Available				
3.6V Flag	-	-	Available				

LVD L

If VDD < 2.0V, system will be reset. Disable LVD24 and LVD36 bit of PFLAG register

LVD M

If VDD < 2.0V, system will be reset.

Enable LVD24 bit of PFLAG register. If VDD > 2.4V, LVD24 is "0". If VDD <= 2.4V, LVD24 flag is "1"

Disable LVD36 bit of PFLAG register

LVD2 H

If VDD < 2.4V, system will be reset.

Enable LVD24 bit of PFLAG register. If VDD > 2.4V, LVD24 is "0". If VDD <= 2.4V, LVD24 flag is "1"

Enable LVD36 bit of PFLAG register. If VDD > 3.6V, LVD36 is "0". If VDD <= 3.6V, LVD36 flag is "1"

* Note:

- 1. After any LVD reset, LVD24, LVD36 flags are cleared.
- 2. The voltage level of LVD 2.4V or 3.6V is for design reference only. Don't use the LVD indicator as precision VDD measurement.

Watchdog reset:

The watchdog timer is a protection to make sure the system executes well. Normally the watchdog timer would be clear at one point of program. Don't clear the watchdog timer in several addresses. The system executes normally and the watchdog won't reset system. When the system is under dead-band and the execution error, the watchdog timer can't be clear by program. The watchdog is continuously counting until overflow occurrence. The overflow signal of watchdog timer triggers the system to reset, and the system return to normal mode after reset sequence. This method also can improve brown out reset condition and make sure the system to return normal mode.

If the system reset by watchdog and the power is still in dead-band, the system reset sequence won't be successful and the system stays in reset status until the power return to normal range. Watchdog timer application note is as following.

Reduce the system executing rate:

If the system rate is fast and the dead-band exists, to reduce the system executing rate can improve the dead-band. The lower system rate is with lower minimum operating voltage. Select the power voltage that's no dead-band issue and find out the mapping system rate. Adjust the system rate to the value and the system exits the dead-band issue. This way needs to modify whole program timing to fit the application requirement.

External reset circuit:

The external reset methods also can improve brown out reset and is the complete solution. There are three external reset circuits to improve brown out reset including "Zener diode reset circuit", "Voltage bias reset circuit" and "External reset IC". These three reset structures use external reset signal and control to make sure the MCU be reset under power dropping and under dead-band. The external reset information is described in the next section.

3.5 EXTERNAL RESET

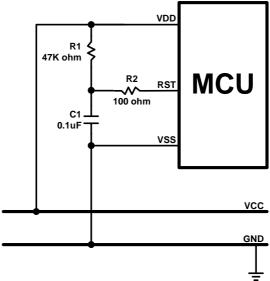

External reset function is controlled by "Reset_Pin" code option. Set the code option as "Reset" option to enable external reset function. External reset pin is Schmitt Trigger structure and low level active. The system is running when reset pin is high level voltage input. The reset pin receives the low voltage and the system is reset. The external reset operation actives in power on and normal running mode. During system power-up, the external reset pin must be high level input, or the system keeps in reset status. External reset sequence is as following.

- External reset (only external reset pin enable): System checks external reset pin status. If external reset pin is
 not high level, the system keeps reset status and waits external reset pin released.
- System initialization: All system registers is set as initial conditions and system is ready.
- Oscillator warm up: Oscillator operation is successfully and supply to system clock.
- **Program executing:** Power on sequence is finished and program executes from ORG 0.

The external reset can reset the system during power on duration, and good external reset circuit can protect the system to avoid working at unusual power condition, e.g. brown out reset in AC power application...

3.6 EXTERNAL RESET CIRCUIT

3.6.1 Simply RC Reset Circuit

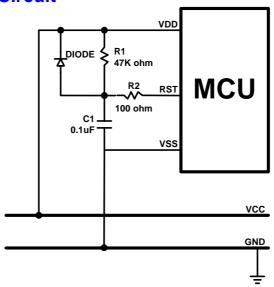

This is the basic reset circuit, and only includes R1 and C1. The RC circuit operation makes a slow rising signal into reset pin as power up. The reset signal is slower than VDD power up timing, and system occurs a power on signal from the timing difference.

Note: The reset circuit is no any protection against unusual power or brown out reset.

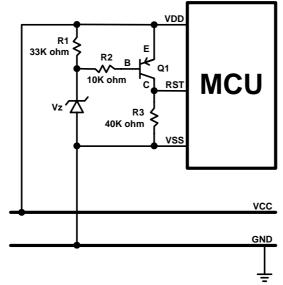

3.6.2 Diode & RC Reset Circuit

This is the better reset circuit. The R1 and C1 circuit operation is like the simply reset circuit to make a power on signal. The reset circuit has a simply protection against unusual power. The diode offers a power positive path to conduct higher power to VDD. It is can make reset pin voltage level to synchronize with VDD voltage. The structure can improve slight brown out reset condition.

Note: The R2 100 ohm resistor of "Simply reset circuit" and "Diode & RC reset circuit" is necessary to limit any current flowing into reset pin from external capacitor C in the event of reset pin breakdown due to Electrostatic Discharge (ESD) or Electrical Over-stress (EOS).

3.6.3 Zener Diode Reset Circuit

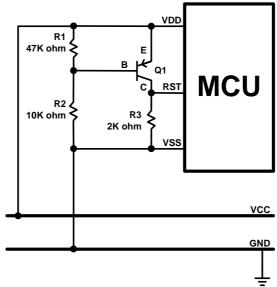

The zener diode reset circuit is a simple low voltage detector and can improve brown out reset condition completely. Use zener voltage to be the active level. When VDD voltage level is above "Vz + 0.7V", the C terminal of the PNP transistor outputs high voltage and MCU operates normally. When VDD is below "Vz + 0.7V", the C terminal of the PNP transistor outputs low voltage and MCU is in reset mode. Decide the reset detect voltage by zener specification. Select the right zener voltage to conform the application.

3.6.4 Voltage Bias Reset Circuit

15867339858

The voltage bias reset circuit is a low cost voltage detector and can **improve brown out reset condition completely**. The operating voltage is not accurate as zener diode reset circuit. Use R1, R2 bias voltage to be the active level. When VDD voltage level is above or equal to "0.7V x (R1 + R2) / R1", the C terminal of the PNP transistor outputs high voltage and MCU operates normally. When VDD is below "0.7V x (R1 + R2) / R1", the C terminal of the PNP transistor outputs low voltage and MCU is in reset mode.

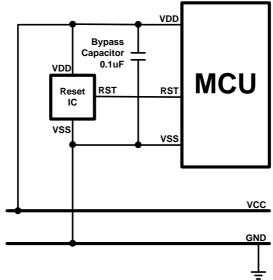

Decide the reset detect voltage by R1, R2 resistances. Select the right R1, R2 value to conform the application. In the circuit diagram condition, the MCU's reset pin level varies with VDD voltage variation, and the differential voltage is 0.7V. If the VDD drops and the voltage lower than reset pin detect level, the system would be reset. If want to make the reset active earlier, set the R2 > R1 and the cap between VDD and C terminal voltage is larger than 0.7V. The external reset circuit is with a stable current through R1 and R2. For power consumption issue application, e.g. DC power system, the current must be considered to whole system power consumption.

Note: Under unstable power condition as brown out reset, "Zener diode rest circuit" and "Voltage bias reset circuit" can protects system no any error occurrence as power dropping. When power drops below the reset detect voltage, the system reset would be triggered, and then system executes reset sequence. That makes sure the system work well under unstable power situation.

3.6.5 External Reset IC

15867339858

The external reset circuit also use external reset IC to enhance MCU reset performance. This is a high cost and good effect solution. By different application and system requirement to select suitable reset IC. The reset circuit can improve all power variation.

4

SYSTEM CLOCK

4.1 OVERVIEW

The micro-controller is a dual clock system. There are high-speed clock and low-speed clock. The high-speed clock is generated from the external oscillator circuit. The low-speed clock is generated from external low-speed 32768Hz oscillator circuit.

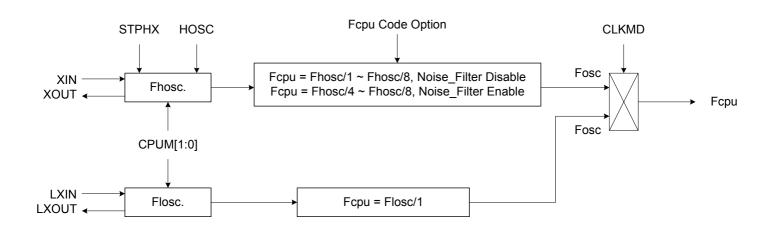

Both the high-speed clock and the low-speed clock can be system clock (Fosc). The system clock in slow mode is fixed Flosc (32768Hz) to be the instruction cycle (Fcpu).

Normal Mode (High Clock): Fcpu = Fhosc / N, N = 1 ~ 8, Select N by Fcpu code option.

Slow Mode (Low Clock): Fcpu = Flosc/1.

SONIX provides a "**Noise Filter**" controlled by code option. In high noisy situation, the noise filter can isolate noise outside and protect system works well. The minimum Fcpu of high clock is limited at **Fhosc/4** when noise filter enable.

4.2 CLOCK BLOCK DIAGRAM

- HOSC: High_Clk code option.
- Fhosc: External high-speed clock.
- Flosc: External 32768Hz low-speed clock.
- Fosc: System clock source.
- Fcpu: Instruction cycle.

4.3 OSCM REGISTER

The OSCM register is an oscillator control register. It controls oscillator status, system mode.

0CAH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
OSCM	0	0	0	CPUM1	CPUM0	CLKMD	STPHX	0
Read/Write	-	-	-	R/W	R/W	R/W	R/W	-
After reset	-	-	-	0	0	0	0	-

Bit 1 STPHX: External high-speed oscillator control bit.

0 = External high-speed oscillator free run.

1 = External high-speed oscillator free run stop. Internal low-speed RC oscillator is still running.

Bit 2 **CLKMD:** System high/Low clock mode control bit.

0 = Normal (dual) mode. System clock is high clock.1 = Slow mode. System clock is internal low clock.

Bit[4:3] **CPUM[1:0]:** CPU operating mode control bits.

00 = normal.

01 = sleep (power down) mode.

10 = green mode.

11 = reserved.

> Example: Stop high-speed oscillator

B0BSET FSTPHX ; To stop external high-speed oscillator only.

Example: When entering the power down mode (sleep mode), both high-speed oscillator and internal low-speed oscillator will be stopped.

B0BSET FCPUM0 ; To stop external high-speed oscillator and internal low-speed

; oscillator called power down mode (sleep mode).

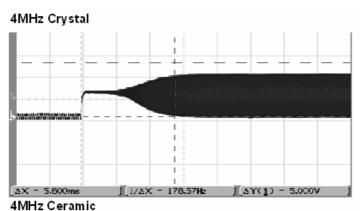

4.4 SYSTEM HIGH CLOCK

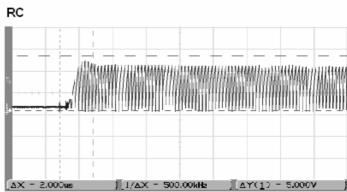

The system high clock is from external oscillator. The high clock type is controlled by "High_Clk" code option.

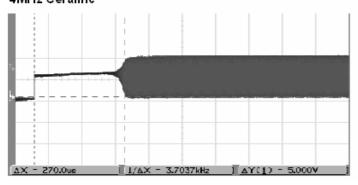

High_Clk Code Option	Description
RC	The high clock is external RC type oscillator. XOUT pin is general purpose I/O pin.
12M	The high clock is external high speed oscillator. The typical frequency is 12MHz.
4M	The high clock is external oscillator. The typical frequency is 4MHz.

4.4.1 EXTERNAL HIGH CLOCK

External high clock includes three modules (Crystal/Ceramic, RC and external clock signal). The high clock oscillator module is controlled by High_Clk code option. The start up time of crystal/ceramic and RC type oscillator is different. RC type oscillator's start-up time is very short, but the crystal's is longer. The oscillator start-up time decides reset time length.

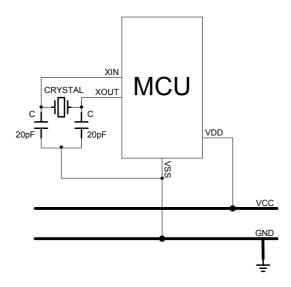

4.4.1.1 CRYSTAL/CERAMIC

15867339858

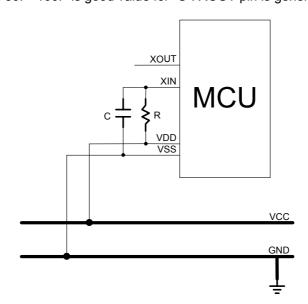

Crystal/Ceramic devices are driven by XIN, XOUT pins. For high/normal/low frequency, the driving currents are different. High_Clk code option supports different frequencies. 12M option is for high speed (ex. 12MHz). 4M option is for normal speed (ex. 4MHz).

Note: Connect the Crystal/Ceramic and C as near as possible to the XIN/XOUT/VSS pins of micro-controller.

4.4.1.2 RC

Selecting RC oscillator is by RC option of High_Clk code option. RC type oscillator's frequency is up to 10MHz. Using "R" value is to change frequency. 50P~100P is good value for "C". XOUT pin is general purpose I/O pin.

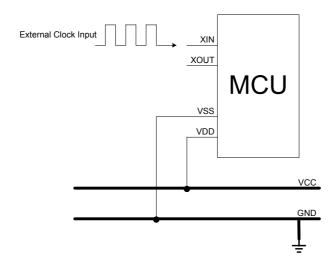

Note: Connect the R and C as near as possible to the VDD pin of micro-controller.

4.4.1.3 EXTERNAL CLOCK SIGNAL

15867339858

Selecting external clock signal input to be system clock is by RC option of High_Clk code option. The external clock signal is input from XIN pin. XOUT pin is general purpose I/O pin.

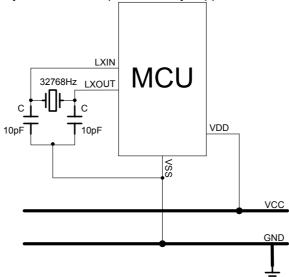

Note: The GND of external oscillator circuit must be as near as possible to VSS pin of micro-controller.

4.5 SYSTEM LOW CLOCK

System low clock is from external low-speed oscillator. External low clock includes three modules (Crystal/Ceramic, RC and external clock signal). The low clock oscillator module is controlled by RCLK bit of LCDM register. The external low clock supports system low clock source and LCD scanning clock source.

4.5.1 CRYSTAL/CERAMIC

Crystal/Ceramic devices are driven by LXIN, LXOUT pins and only supports 32768Hz oscillator.

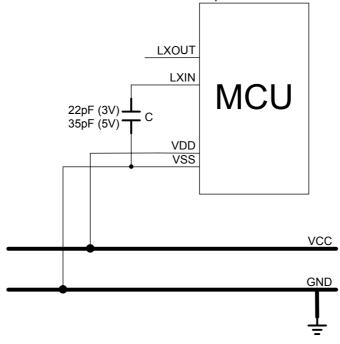

Note: Connect the Crystal/Ceramic and C as near as possible to the LXIN/LXOUT/VSS pins of micro-controller. The capacitor between LXIN/LXOUT and VSS must be 10pF.

4.5.2 RC

15867339858

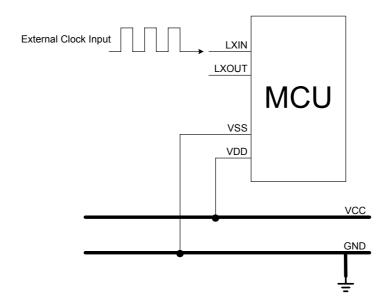

Selecting RC oscillator is by RCLK bit of LCDM register. RC type oscillator's frequency is 32768Hz. The external 32K RC type circuit only needs a capacitor, and don't connect a resistor between LXIN and VDD. **22pF @3V** and **35pF @5V** is a good value for "C" connected from LXIN to VSS. LXOUT pin is useless in external low RC mode.

Note: Connect the C as near as possible to the VSS pin of micro-controller. The frequency of external low RC is decided by the capacitor value. Adjust capacitor value to about 32KHz frequency.

4.5.3 EXTERNAL CLOCK SIGNAL

Selecting external clock signal input to be system clock is by RCLK bit of LCDM register. The external clock signal is input from LXIN pin. LXOUT pin is useless.

he GND of external oscillator circuit must be as near as possible to VSS pin of micro-controller.

4.5.4 SYSTEM CLOCK MEASUREMENT

15867339858

Under design period, the users can measure system clock speed by software instruction cycle (Fcpu). This way is useful in RC mode.

> Example: Fcpu instruction cycle of external oscillator.

B0BSET P0M.0 ; Set P0.0 to be output mode for outputting Fcpu toggle signal.

@@:

B0BSET P0.0 ; Output Fcpu toggle signal in low-speed clock mode. B0BCLR P0.0 ; Measure the Fcpu frequency by oscilloscope.

JMP @B

Note: Do not measure the RC frequency directly from XIN; the probe impendence will affect the RC frequency.

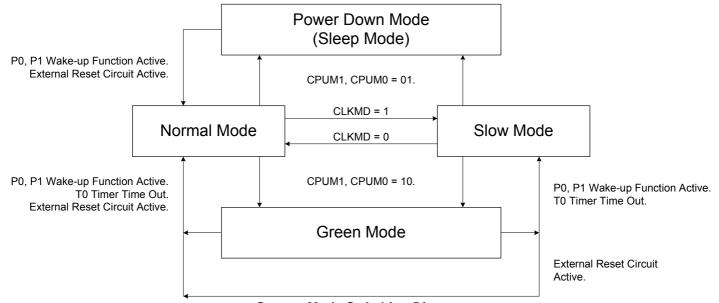

5

SYSTEM OPERATION MODE

5.1 OVERVIEW

The chip is featured with low power consumption by switching around four different modes as following.

- Normal mode (High-speed mode)
- Slow mode (Low-speed mode)
- Power-down mode (Sleep mode)
- Green mode

System Mode Switching Diagram

Operating mode description

MODE	NORMAL	SLOW	GREEN	POWER DOWN (SLEEP)	REMARK

EHOSC: External high clock.

ELRC: External low clock (32768Hz).

5.2 SYSTEM MODE SWITCHING

15867339858

Example: Switch normal/slow mode to power down (sleep) mode.

BOBSET FCPUMO ; Set CPUMO = 1.

- * Note: During the sleep, only the wakeup pin and reset can wakeup the system back to the normal mode.
- > Example: Switch normal mode to slow mode.

BOBSET FCLKMD ;To set CLKMD = 1, Change the system into slow mode BOBSET FSTPHX ;To stop external high-speed oscillator for power saving.

Example: Switch slow mode to normal mode (The external high-speed oscillator is still running)

B0BCLR FCLKMD ;To set CLKMD = 0

> Example: Switch slow mode to normal mode (The external high-speed oscillator stops)

If external high clock stop and program want to switch back normal mode. It is necessary to delay at least 20ms for external clock stable.

BOBCLR FSTPHX ; Turn on the external high-speed oscillator.

B0MOV Z, #54 ; If VDD = 5V, internal RC=32KHz (typical) will delay @@: DECMS Z ; 0.125ms X 162 = 20.25ms for external clock stable

JMP @B

B0BCLR FCLKMD ; Change the system back to the normal mode

> Example: Switch normal/slow mode to green mode.

BOBSET FCPUM1 ; Set CPUM1 = 1.

* Note: If T0 timer wakeup function is disabled in the green mode, only the wakeup pin and reset pin can wakeup the system backs to the previous operation mode.

> Example: Switch normal/slow mode to Green mode and enable T0 wakeup function 1867339858

; Set T0 time	r wakeup function		
	B0BCLR	FT0IEN	; To disable T0 interrupt service
	B0BCLR	FT0ENB	; To disable T0 timer
	MOV	A.#20H	:
	B0MOV	TOM.A	; To set T0 clock = Fcpu / 64
	MOV	A.#74H	,
	B0MOV	TOC,A	; To set T0C initial value = 74H (To set T0 interval = 10 ms)
	B0BCLR B0BCLR B0BSET	FT0IEN FT0IRQ FT0ENB	; To disable T0 interrupt service ; To clear T0 interrupt request ; To enable T0 timer
; Go into gree	en mode		
	B0BCLR	FCPUM0	;To set CPUMx = 10
	B0BSET	FCPUM1	

^{*} Note: During the green mode with T0 wake-up function, the wakeup pins, reset pin and T0 can wakeup the system back to the last mode. T0 wake-up period is controlled by program and T0ENB must be set.

5.3 WAKEUP

15867339858

5.3.1 OVERVIEW

Under power down mode (sleep mode) or green mode, program doesn't execute. The wakeup trigger can wake the system up to normal mode or slow mode. The wakeup trigger sources are external trigger (P0, P1 level change) and internal trigger (T0 timer overflow).

- Power down mode is waked up to normal mode. The wakeup trigger is only external trigger (P0, P1 level change)
- Green mode is waked up to last mode (normal mode or slow mode). The wakeup triggers are external trigger (P0, P1 level change) and internal trigger (T0 timer overflow).

5.3.2 WAKEUP TIME

When the system is in power down mode (sleep mode), the high clock oscillator stops. When waked up from power down mode, MCU waits for 2048 external high-speed oscillator clocks as the wakeup time to stable the oscillator circuit. After the wakeup time, the system goes into the normal mode.

Note: Wakeup from green mode is no wakeup time because the clock doesn't stop in green mode.

The value of the wakeup time is as the following.

The Wakeup time = 1/Fosc * 2048 (sec) + high clock start-up time

- Note: The high clock start-up time is depended on the VDD and oscillator type of high clock.
- Example: In power down mode (sleep mode), the system is waked up. After the wakeup time, the system goes into normal mode. The wakeup time is as the following.

The wakeup time = 1/Fosc * 2048 = 0.512 ms (Fosc = 4MHz) The total wakeup time = 0.512 ms + oscillator start-up time

* Note: The wakeup function of P0 can't be disabled. Make sure enable the pull-up resistor of P0 or use external pull-up resistors before enter sleep mode.

5.3.3 P1W WAKEUP CONTROL REGISTER

15867339858

Under power down mode (sleep mode) and green mode, the I/O ports with wakeup function are able to wake the system up to normal mode. The Port 0 and Port 1 have wakeup function. Port 0 wakeup function always enables, but the Port 1 is controlled by the P1W register.

0C0H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
P1W	-	P16W	P15W	P14W	P13W	P12W	P11W	P10W
Read/Write	-	W	W	W	W	W	W	W
After reset	-	0	0	0	0	0	0	0

Bit[6:0] P10W~P16W: Port 1 wakeup function control bits.

0 = Disable P1n wakeup function.

1 = Enable P1n wakeup function.

I/O PORT I/O PORT MODE

The port direction is programmed by PnM register. All I/O ports can select input or output direction.

0B8H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
P0M	-	-	-	-	P03M	-	P01M	P00M

After reset	-	-	0	0	0	0	0	0

PnM[7:0]: Pn mode control bits. (n = $0\sim5$). Bit[7:0]

0 = Pn is input mode.

1 = Pn is output mode.

Note:

- 1. Users can program them by bit control instructions (B0BSET, B0BCLR).
- P0.2 input only pin, and the P0M.2 keeps "1".
 P3 is shared with SEG24~SEG31 controlled by P3SEG bit of LCDM register.
- 4. After power on or reset, P3 default state as input LOW.

Example: I/O mode selecting

CLR P₀M ; Set all ports to be input mode.

CLR P₁M **CLR** P₅M

MOV A, #0FFH ; Set all ports to be output mode.

B0MOV P0M, A **B0MOV** P1M,A **B0M0V** P5M, A

B0BCLR P1M.0 ; Set P1.0 to be input mode.

BOBSET P1M.0 ; Set P1.0 to be output mode.

Example: P3 I/O mode selecting

15867339858

B0BSET	FP3SEG	; Enable P3 I/O function.
CLR	P3M	; Set P3 port to be input mode.
MOV B0MOV	A, #0FFH P3M, A	; Set P3 port to be output mode.
B0BCLR	P3M.0	; Set P3.0 to be input mode.
B0BSET	P3M.0	; Set P3.0 to be output mode.

Read/Write	-	-	R/W	R/W	R/W	R/W	R/W	R/W
After reset	-	1	0	0	0	0	0	0

Note: P0.2 keeps "1" when external reset enable by code option.

> Example: Read data from input port.

B0MOV A, P0 ; Read data from Port 0 B0MOV A, P1 ; Read data from Port 1 B0MOV A, P3 ; Read data from Port 3 B0MOV A, P5 ; Read data from Port 5

> Example: Write data to output port.

MOV A, #0FFH ; Write data FFH to all Port. B0MOV P0, A B0MOV P1, A

B0MOV P3, A B0MOV P5, A

> Example: Write one bit data to output port.

B0BSET P1.0 ; Set P1.0 and P5.3 to be "1".

B0BSET P5.3

B0BCLR P1.0 ; Set P1.0 and P5.3 to be "0".

B0BCLR P5.3

6.4 PORT 5 RFC SHARE PIN

15867339858

Port 5 is shared with RFC input and output pins. P5.0~P5.2 pins are RFC channel 0~2 input pins. P5.3 is RFC feedback clock input. P5.5 is RFC output pins. If RFC enable (RFCENB=1), P5.0~P5.3 are switched to RFC input mode and digital I/O functions are disabled. P5.5 RFC output function is controlled by RFCOUT bit of RFCM register.

Note:

- 1. If RFCENB=1, P5.0~P5.3 must be set to input mode without pull-up resistors by program first.
- 2. If RFCOUT=1, P5.5 must be set to input mode without pull-up resistor by program first.

0A3H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
RFCM	RFCOUT	-	-	-	-	RFCH1	RFCH2	RFCENB
Read/Write	R/W	-	-	-	-	R/W	R/W	R/W
After reset	0	-	-	-	-	0	0	0

Bit7 **RFCOUT:** RFCOUT control bit.

0 = RFC output disable. P5.5 is general purpose I/O mode.

1 = RFC output enable. P5.5 is RFC output pin.

Bit0 RFCENB: RFC mode control bit.

0 = RFC disable. P5.0~P5.3 are general purpose I/O mode.

1 = RFC enable. P5.0~P5.3 are RFC input mode.

Example: Set P5.0~P5.3 to general purpose I/O mode from RFC mode.

B0BCLR FRFCENB ; Disable RFC mode, and P5.0~P5.3 switch to I/O mode.

... ; P5.0~P5.3 I/O mode control.

Example: Set P5.0~P5.3 to RFC mode.

CLR P5UR ; Disable P5 pull-up resistor.

MOV A. #11110000B

AND P5M, A ; Set P5.0~P5.3 to input mode.

B0BSET FRFCENB ; Enable RFC mode and P5.0~P5.3 switch to RFC input

; mode.

> Example: Set P5.5 to general purpose I/O mode from RFC output mode.

BOBCLR FRECOUT ; Disable REC output mode, and P5.5 switches to I/O mode.

... ; P5.5 I/O mode control.

> Example: Set P5.5 to RFC output mode.

CLR P5UR ; Disable P5 pull-up resistor.

MOV A. #11101111B

AND P5M, A ; Set P5.5 to input mode.

B0BSET FRFCOUT ; Enable RFC output mode and P5.5 switch to RFC output

; mode.

. . .

7 TIMERS

7.1 WATCHDOG TIMER

The watchdog timer (WDT) is a binary up counter designed for monitoring program execution. If the program goes into the unknown status by noise interference, WDT overflow signal raises and resets MCU. Watchdog clock controlled by code option and the clock source is internal low-speed oscillator (16KHz @3V, 32KHz @5V).

Watchdog overflow time = 8192 / Internal Low-Speed oscillator (sec).

VDD	Internal Low RC Freq.	Watchdog Overflow Time
3V	16KHz	512ms
5V	32KHz	256ms

* Note: If watchdog is "Always_On" mode, it keeps running event under power down mode or green mode.

Watchdog clear is controlled by WDTR register. Moving **0x5A** data into WDTR is to reset watchdog timer.

0CCH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
WDTR	WDTR7	WDTR6	WDTR5	WDTR4	WDTR3	WDTR2	WDTR1	WDTR0
Read/Write	W	W	W	W	W	W	W	W
After reset	0	0	0	0	0	0	0	0

Example: An operation of watchdog timer is as following. To clear the watchdog timer counter in the top of the main routine of the program.

Main:

MOV B0MOV	A,#5AH WDTR,A	; Clear the watchdog timer.
CALL CALL	SUB1 SUB2	
 JMP	MAIN	

Watchdog timer application note is as following.

15867339858

- Before clearing watchdog timer, check I/O status and check RAM contents can improve system error.
- Don't clear watchdog timer in interrupt vector and interrupt service routine. That can improve main routine fail.
- Clearing watchdog timer program is only at one part of the program. This way is the best structure to enhance the watchdog timer function.
- > Example: An operation of watchdog timer is as following. To clear the watchdog timer counter in the top of the main routine of the program.

Main: ; Check I/O. . . . ; Check RAM JMP \$ Err: ; I/O or RAM error. Program jump here and don't ; clear watchdog. Wait watchdog timer overflow to reset IC. Correct: ; I/O and RAM are correct. Clear watchdog timer and ; execute program. **BOBSET FWDRST** ; Only one clearing watchdog timer of whole program. **CALL** SUB1

> CALL ...

JMP MAIN

SUB2

7.2 TIMER 0 (T0)

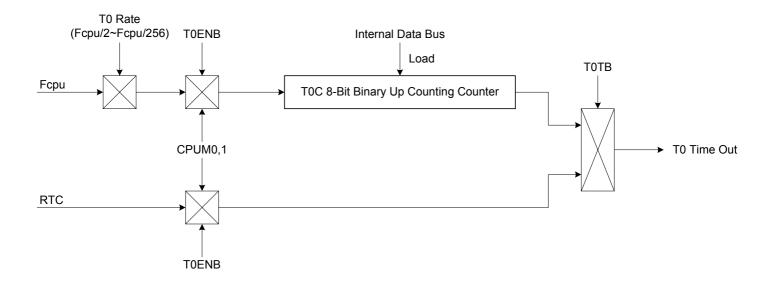

15867339858

7.2.1 OVERVIEW

The T0 is an 8-bit binary up timer and event counter. If T0 timer occurs an overflow (from FFH to 00H), it will continue counting and issue a time-out signal to trigger T0 interrupt to request interrupt service.

The main purposes of the T0 timer is as following.

- **8-bit programmable up counting timer:** Generates interrupts at specific time intervals based on the selected clock frequency.
- RTC timer: Generates interrupts at real time intervals based on the selected clock source. RTC function is only available in T0TB=1.
- Green mode wakeup function: To can be green mode wake-up time as T0ENB = 1. System will be wake-up by T0 time out.

Note: In RTC mode, the T0 interval time is fixed at 0.5 sec and isn't controlled by T0C.

7.2.2 TOM MODE REGISTER

15867339858

0D8H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TOM	T0ENB	T0rate2	T0rate1	T0rate0	-	TC0X8	-	T0TB
Read/Write	R/W	R/W	R/W	R/W	-	R/W	-	R/W
After reset	0	0	0	0	-	0	-	0

Bit 0 TOTB: RTC clock source control bit.

0 = Disable RTC (T0 clock source from Fcpu).

1 = Enable RTC.

TORATE[2:0]: T0 internal clock select bits. Bit [6:4]

000 = fcpu/256.

001 = fcpu/128.

110 = fcpu/4.

111 = fcpu/2.

Bit 7 T0ENB: T0 counter control bit.

0 = Disable T0 timer.

1 = Enable T0 timer.

Note: TORATE is not available in RTC mode. The T0 interval time is fixed at 0.5 sec.

7.2.3 TOC COUNTING REGISTER

15867339858

TOC is an 8-bit counter register for T0 interval time control.

0D9H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
T0C	T0C7	T0C6	T0C5	T0C4	T0C3	T0C2	T0C1	T0C0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

The equation of T0C initial value is as following.

TOC initial value = 256 - (T0 interrupt interval time * input clock)

Example: To set 10ms interval time for T0 interrupt. High clock is external 4MHz. Fcpu=Fosc/4. Select T0RATE=010 (Fcpu/64).

The basic timer table interval time of T0.

The basic affer table interval affect in 16.										
T0RATE	TORATE TOCLOCK	High speed mode	(Fcpu = 4MHz / 4)	Low speed mode (Fcpu = 32768Hz / 4)						
TOTALL	TOCLOCK	Max overflow interval	One step = max/256	Max overflow interval	One step = max/256					
000	Fcpu/256	65.536 ms	256 us	8000 ms	31250 us					
001	Fcpu/128	32.768 ms	128 us	4000 ms	15625 us					
010	Fcpu/64	16.384 ms	64 us	2000 ms	7812.5 us					
011	Fcpu/32	8.192 ms	32 us	1000 ms	3906.25 us					
100	Fcpu/16	4.096 ms	16 us	500 ms	1953.125 us					
101	Fcpu/8	2.048 ms	8 us	250 ms	976.563 us					
110	Fcpu/4	1.024 ms	4 us	125 ms	488.281 us					
111	Fcpu/2	0.512 ms	2 us	62.5 ms	244.141 us					

Note: T0C is not available in RTC mode. The T0 interval time is fixed at 0.5 sec.

7.2.4 TO TIMER OPERATION SEQUENCE

15867339858

T0 timer operation sequence of setup T0 timer is as following.

Stop T0 timer counting, disable T0 interrupt function and clear T0 interrupt request flag.

B0BCLR FT0ENB ; T0 timer.

B0BCLR FT0IEN ; T0 interrupt function is disabled. B0BCLR FT0IRQ ; T0 interrupt request flag is cleared.

Set T0 timer rate.

MOV A, #0xxx0000b ;The T0 rate control bits exist in bit4~bit6 of T0M. The

; value is from x000xxxxb~x111xxxxb.

B0MOV T0M,A ; T0 timer is disabled.

Set T0 clock source from Fcpu or RTC.

BOBCLR FTOTB ; Select TO Fcpu clock source.

or
B0BSET FT0TB ; Select T0 RTC clock source.

Set T0 interrupt interval time.

MOV A,#7FH

B0MOV T0C,A ; Set T0C value.

Set T0 timer function mode.

BOBSET FTOIEN ; Enable T0 interrupt function.

Enable T0 timer.

B0BSET FT0ENB ; Enable T0 timer.

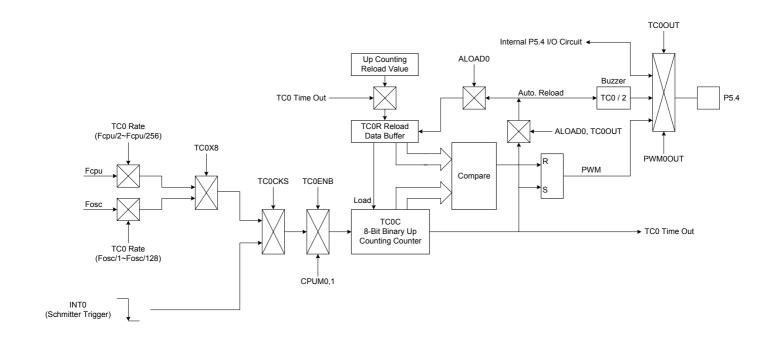

7.3 TIMER/COUNTER 0 (TC0)

7.3.1 OVERVIEW

The TC0 is an 8-bit binary up counting timer with double buffers. TC0 has two clock sources including internal clock and external clock for counting a precision time. The internal clock source is from Fcpu or Fosc controlled by TC0X8 flag to get faster clock source (Fosc). The external clock is INT0 from P0.0 pin (Falling edge trigger). Using TC0M register selects TC0C's clock source from internal or external. If TC0 timer occurs an overflow, it will continue counting and issue a time-out signal to trigger TC0 interrupt to request interrupt service. TC0 overflow time is 0xFF to 0X00 normally. Under PWM mode, TC0 overflow is decided by PWM cycle controlled by ALOAD0 and TC0OUT bits.

The main purposes of the TC0 timer is as following.

- **8-bit programmable up counting timer:** Generates interrupts at specific time intervals based on the selected clock frequency.
- **External event counter:** Counts system "events" based on falling edge detection of external clock signals at the INT0 input pin.
- Buzzer output
- PWM output

7.3.2 TC0M MODE REGISTER

15867339858

0DAH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC0M	TC0ENB	TC0rate2	TC0rate1	TC0rate0	TC0CKS	ALOAD0	TC0OUT	PWM0OUT
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
After reset	0	0	0	0	0	0	0	0

Bit 0 **PWM0OUT:** PWM output control bit.

0 = Disable PWM output.

1 = Enable PWM output. PWM duty controlled by TC0OUT, ALOAD0 bits.

Bit 1 **TC0OUT:** TC0 time out toggle signal output control bit. **Only valid when PWM0OUT = 0.**

0 = Disable, P5.4 is I/O function.

1 = Enable, P5.4 is output TC0OUT signal.

Bit 2 ALOAD0: Auto-reload control bit. Only valid when PWM0OUT = 0.

0 = Disable TC0 auto-reload function.

1 = Enable TC0 auto-reload function.

Bit 3 **TC0CKS:** TC0 clock source select bit.

0 = Internal clock (Fcpu or Fosc).

1 = External clock from P0.0/INT0 pin.

Bit [6:4] TCORATE[2:0]: TC0 internal clock select bits.

TC0RATE [2:0]	TC0X8 = 0	TC0X8 = 1
000	Fcpu / 256	Fosc / 128
001	Fcpu / 128	Fosc / 64
010	Fcpu / 64	Fosc / 32
011	Fcpu / 32	Fosc / 16
100	Fcpu / 16	Fosc / 8
101	Fcpu / 8	Fosc / 4
110	Fcpu / 4	Fosc / 2
111	Fcpu / 2	Fosc / 1

Bit 7 **TC0ENB:** TC0 counter control bit.

0 = Disable TC0 timer.

1 = Enable TC0 timer.

Note: When TC0CKS=1, TC0 became an external event counter and TC0RATE is useless. No more P0.0 interrupt request will be raised. (P0.0IRQ will be always 0).

7.3.3 TC0X8 FLAG

15867339858

0D8H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TOM	-	-	-	-	-	TC0X8	-	-
Read/Write	-	-	-	-	-	R/W	-	-
After reset	-	-	-	-	-	0	-	-

Bit 2 **TC0X8:** TC0 internal clock source control bit.

0 = TC0 internal clock source is Fcpu. TC0RATE is from Fcpu/2~Fcpu/256.

1 = TC0 internal clock source is Fosc. TC0RATE is from Fosc/1~Fosc/128.

Note: Under TC0 event counter mode (TC0CKS=1), TC0X8 bit and TC0RATE are useless.

7.3.4 TC0C COUNTING REGISTER

TC0C is an 8-bit counter register for TC0 interval time control.

0DBH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC0C	TC0C7	TC0C6	TC0C5	TC0C4	TC0C3	TC0C2	TC0C1	TC0C0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

The equation of TC0C initial value is as following.

TC0C initial value = N - (TC0 interrupt interval time * input clock)

N is TC0 overflow boundary number. TC0 timer overflow time has six types (TC0 timer, TC0 event counter, TC0 Fcpu clock source, TC0 Fosc clock source, PWM mode and no PWM mode). These parameters decide TC0 overflow time and valid value as follow table.

TC0CKS	TC0X8	PWM0	ALOAD0	TC0OUT	N	TC0C valid value	TC0C value binary type	Remark
	0	0	Х	Х	256	0x00~0xFF	00000000b~1111111b	Overflow per 256 count
	0	1	0	0	256	0x00~0xFF 00000000b~11111111b		Overflow per 256 count
	(Fcpu/2~	1	0	1	64	0x00~0x3F	xx000000b~xx111111b	Overflow per 64 count
	Fcpu/256)	1	1	0	32	0x00~0x1F	xxx00000b~xxx11111b	Overflow per 32 count
0	1 opu/200)	1		1	16	0x00~0x0F	xxxx0000b~xxxx1111b	Overflow per 16 count
0		0	Х	Х	256	0x00~0xFF	00000000b~1111111b	Overflow per 256 count
	1	1	0	0	256	0x00~0xFF	00000000b~1111111b	Overflow per 256 count
	(Fosc/1~	1	0	1	64	0x00~0x3F	xx000000b~xx111111b	Overflow per 64 count
	Fosc/128)	1	1	0	32	0x00~0x1F	xxx00000b~xxx11111b	Overflow per 32 count
		1	1	1	16	0x00~0x0F	xxxx0000b~xxxx1111b	Overflow per 16 count
1	-	-	-	-	256	0x00~0xFF	00000000b~1111111b	Overflow per 256 count

Example: To set 10ms interval time for TC0 interrupt. TC0 clock source is Fcpu (TO(F)) (TO(F))

TCOC initial value = N - (TC0 interrupt interval time * input clock)
=
$$256$$
 - ($10ms * 4MHz / 4 / 64$)
= 256 - ($10^{-2} * 4 * 10^{6} / 4 / 64$)
= 100
= $64H$

The basic timer table interval time of TC0, TC0X8 = 0.

TCOBATE	TC0CLOCK	High speed mode	(Fcpu = 4MHz / 4)	Low speed mode (F	cpu = 32768Hz / 4)
TOURATE	TOOCLOCK	Max overflow interval	One step = max/256	Max overflow interval	One step = max/256
000	Fcpu/256	65.536 ms	256 us	8000 ms	31250 us
001	Fcpu/128	32.768 ms	128 us	4000 ms	15625 us
010	Fcpu/64	16.384 ms	64 us	2000 ms	7812.5 us
011	Fcpu/32	8.192 ms	32 us	1000 ms	3906.25 us
100	Fcpu/16	4.096 ms	16 us	500 ms	1953.125 us
101	Fcpu/8	2.048 ms	8 us	250 ms	976.563 us
110	Fcpu/4	1.024 ms	4 us	125 ms	488.281 us
111	Fcpu/2	0.512 ms	2 us	62.5 ms	244.141 us

The basic timer table interval time of TC0, TC0X8 = 1.

TCODATE	TC0CLOCK	High speed mode	(Fcpu = 4MHz / 4)	Low speed mode (F	cpu = 32768Hz / 4)					
TOURATE	TOOCLOCK	Max overflow interval	One step = max/256	Max overflow interval	One step = max/256					
000	Fosc/128	8.192 ms	32 us	1000 ms	7812.5 us					
001	Fosc/64	4.096 ms	16 us	500 ms	3906.25 us					
010	Fosc/32	2.048 ms	8 us	250 ms	1953.125 us					
011	Fosc/16	1.024 ms	4 us	125 ms	976.563 us					
100	Fosc/8	0.512 ms	2 us	62.5 ms	488.281 us					
101	Fosc/4	0.256 ms	1 us	31.25 ms	244.141 us					
110	Fosc/2	0.128 ms	0.5 us	15.625 ms	122.07 us					
111	Fosc/1	0.064 ms	0.25 us	7.813 ms	61.035 us					

7.3.5 TC0R AUTO-LOAD REGISTER

15867339858

TC0 timer is with auto-load function controlled by ALOAD0 bit of TC0M. When TC0C overflow occurring, TC0R value will load to TC0C by system. It is easy to generate an accurate time, and users don't reset TC0C during interrupt service routine.

TC0 is double buffer design. If new TC0R value is set by program, the new value is stored in 1st buffer. Until TC0 overflow occurs, the new value moves to real TC0R buffer. This way can avoid TC0 interval time error and glitch in PWM and Buzzer output.

Note: Under PWM mode, auto-load is enabled automatically. The ALOAD0 bit is selecting overflow boundary.

0CDH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
TC0R	TC0R7	TC0R6	TC0R5	TC0R4	TC0R3	TC0R2	TC0R1	TC0R0
Read/Write	W	W	W	W	W	W	W	W
After reset	0	0	0	0	0	0	0	0

The equation of TC0R initial value is as following.

TCOR initial value = N - (TCO interrupt interval time * input clock)

N is TC0 overflow boundary number. TC0 timer overflow time has six types (TC0 timer, TC0 event counter, TC0 Fcpu clock source, TC0 Fosc clock source, PWM mode and no PWM mode). These parameters decide TC0 overflow time and valid value as follow table.

TC0CKS	TC0X8	PWM0	ALOAD0	TC0OUT	N	TC0R valid value	TC0R value binary type
	0	0	Х	Х	256	0x00~0xFF	00000000b~1111111b
	0	1	0	0	256	0x00~0xFF	00000000b~1111111b
	(Fcpu/2~	1	0	1	64	0x00~0x3F	xx000000b~xx111111b
	Fcpu/256)	1	1	0	32	0x00~0x1F	xxx00000b~xxx11111b
0	1 opu/200)	1	1	1	16	0x00~0x0F	xxxx0000b~xxxx1111b
U		0	Х	Х	256	0x00~0xFF	00000000b~1111111b
	1	1	0	0	256	0x00~0xFF	00000000b~1111111b
	(Fosc/1~	1	0	1	64	0x00~0x3F	xx000000b~xx111111b
	Fosc/128)	1	1	0	32	0x00~0x1F	xxx00000b~xxx11111b
		1	1	1	16	0x00~0x0F	xxxx0000b~xxxx1111b
1	-	-	-	-	256	0x00~0xFF	00000000b~1111111b

Example: To set 10ms interval time for TC0 interrupt. TC0 clock source is Fcpu (TC0KS=0, TC0X8=0) and no PWM output (PWM0=0). High clock is external 4MHz. Fcpu=Fosc/4. Select TC0RATE=010 (Fcpu/64).

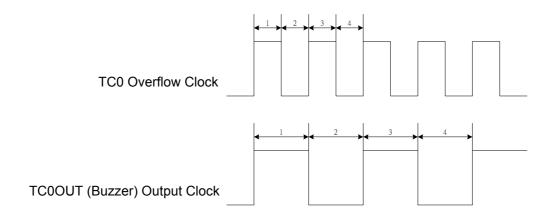

TCOR initial value = N - (TC0 interrupt interval time * input clock) = 256 - (10ms * 4MHz / 4 / 64) = 256 - ($10^{-2} * 4 * 10^{6} / 4 / 64$) = 100= 64H

7.3.6 TC0 CLOCK FREQUENCY OUTPUT (BUZZER)

15867339858

Buzzer output (TC0OUT) is from TC0 timer/counter frequency output function. By setting the TC0 clock frequency, the clock signal is output to P5.4 and the P5.4 general purpose I/O function is auto-disable. The TC0OUT frequency is divided by 2 from TC0 interval time. TC0OUT frequency is 1/2 TC0 frequency. The TC0 clock has many combinations and easily to make difference frequency. The TC0OUT frequency waveform is as following.

Example: Setup TC0OUT output from TC0 to TC0OUT (P5.4). The external high-speed clock is 4MHz. The TC0OUT frequency is 0.5KHz. Because the TC0OUT signal is divided by 2, set the TC0 clock to 1KHz. The TC0 clock source is from external oscillator clock. T0C rate is Fcpu/4. The TC0RATE2~TC0RATE1 = 110. TC0C = TC0R = 131.

MOV B0MOV	A,#01100000B TC0M,A	; Set the TC0 rate to Fcpu/4
MOV B0MOV B0MOV	A,#131 TC0C,A TC0R,A	; Set the auto-reload reference value
B0BSET B0BSET B0BSET	FTC0OUT FALOAD1 FTC0ENB	; Enable TC0 output to P5.4 and disable P5.4 I/O function ; Enable TC0 auto-reload function ; Enable TC0 timer

Note: Buzzer output is enable, and "PWM0OUT" must be "0".

7.3.7 TC0 TIMER OPERATION SEQUENCE

15867339858

TC0 timer operation includes timer interrupt, event counter, TC0OUT and PWM. The sequence of setup TC0 timer is as following.

Stop TC0 timer counting, disable TC0 interrupt function and clear TC0 interrupt request flag.

B0BCLR FTC0ENB ; TC0 timer, TC0OUT and PWM stop.
B0BCLR FTC0IEN ; TC0 interrupt function is disabled.
B0BCLR FTC0IRQ ; TC0 interrupt request flag is cleared.

Set TC0 timer rate. (Besides event counter mode.)

MOV A, #0xxx0000b ;The TC0 rate control bits exist in bit4~bit6 of TC0M. The

; value is from x000xxxxb~x111xxxxb.

B0MOV TC0M,A ; TC0 interrupt function is disabled.

Set TC0 timer clock source.

; Select TC0 internal / external clock source.

BOBCLR FTCOCKS ; Select TC0 internal clock source.

or

BOBSET FTCOCKS ; Select TC0 external clock source.

; Select TC0 Fcpu / Fosc internal clock source .

B0BCLR FTC0X8 ; Select TC0 Fcpu internal clock source.

or

or

or

or

B0BSET FTC0X8 ; Select TC0 Fosc internal clock source.

Note: TC0X8 is useless in TC0 external clock source mode.

Set TC0 timer auto-load mode.

B0BCLR FALOAD0 ; Enable TC0 auto reload function.

RORSET

BOBSET FALOADO ; Disable TC0 auto reload function.

Set TC0 interrupt interval time, TC0OUT (Buzzer) frequency or PWM duty cycle.

; Set TC0 interrupt interval time, TC0OUT (Buzzer) frequency or PWM duty.

MOV A,#7FH ; TC0C and TC0R value is decided by TC0 mode.

B0MOV TC0C,A ; Set TC0C value.

B0MOV TC0R,A ; Set TC0R value under auto reload mode or PWM mode.

; In PWM mode, set PWM cycle.

B0BCLR FALOAD0 ; ALOAD0, TC0OUT = 00, PWM cycle boundary is

B0BCLR FTC0OUT ; 0~255.

or

B0BCLR FALOAD0 ; ALOAD0, TC0OUT = 01, PWM cycle boundary is

BOBSET FTCOOUT ; 0~63.

B0BSET FALOAD0 ; ALOAD0, TC0OUT = 10, PWM cycle boundary is

B0BCLR FTC0OUT ; 0~31.

B0BSET FALOAD0 ; ALOAD0, TC0OUT = 11, PWM cycle boundary is

BOBSET FTCOOUT ; 0~15.

Set TC0 timer function mode.

15867339858

BOBSET FTC0IEN ; Enable TC0 interrupt function. or

B0BSET FTC0OUT ; Enable TC0OUT (Buzzer) function.

B0BSET FPWM0OUT ; Enable PWM function.

Enable TC0 timer.

or

B0BSET FTC0ENB ; Enable TC0 timer.

7.4 PWM0 MODE

15867339858

7.4.1 OVERVIEW

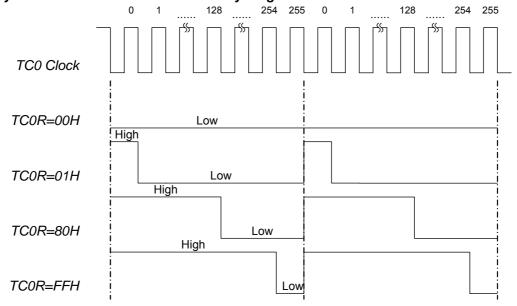

PWM function is generated by TC0 timer counter and output the PWM signal to PWM0OUT pin (P5.4). The 8-bit counter counts modulus 256, 64, 32, 16 controlled by ALOAD0, TC0OUT bits. The value of the 8-bit counter (TC0C) is compared to the contents of the reference register (TC0R). When the reference register value (TC0R) is equal to the counter value (TC0C), the PWM output goes low. When the counter reaches zero, the PWM output is forced high. The low-to-high ratio (duty) of the PWM0 output is TC0R/256, 64, 32, 16.

PWM output can be held at low level by continuously loading the reference register with 00H. Under PWM operating, to change the PWM's duty cycle is to modify the TC0R.

Note: TC0 is double buffer design. Modifying TC0R to change PWM duty by program, there is no glitch and error duty signal in PWM output waveform. Users can change TC0R any time, and the new reload value is loaded to TC0R buffer at TC0 overflow.

ALOAD0	TC0OUT	PWM duty range	TC0C valid value	TC0R valid bits value	MAX. PWM Frequency (Fcpu = 4MHz)	Remark
0	0	0/256~255/256	0x00~0xFF	0x00~0xFF	7.8125K	Overflow per 256 count
0	1	0/64~63/64	0x00~0x3F	0x00~0x3F	31.25K	Overflow per 64 count
1	0	0/32~31/32	0x00~0x1F	0x00~0x1F	62.5K	Overflow per 32 count
1	1	0/16~15/16	0x00~0x0F	0x00~0x0F	125K	Overflow per 16 count

The Output duty of PWM is with different TCOR. Duty range is from 0/256~255/256.

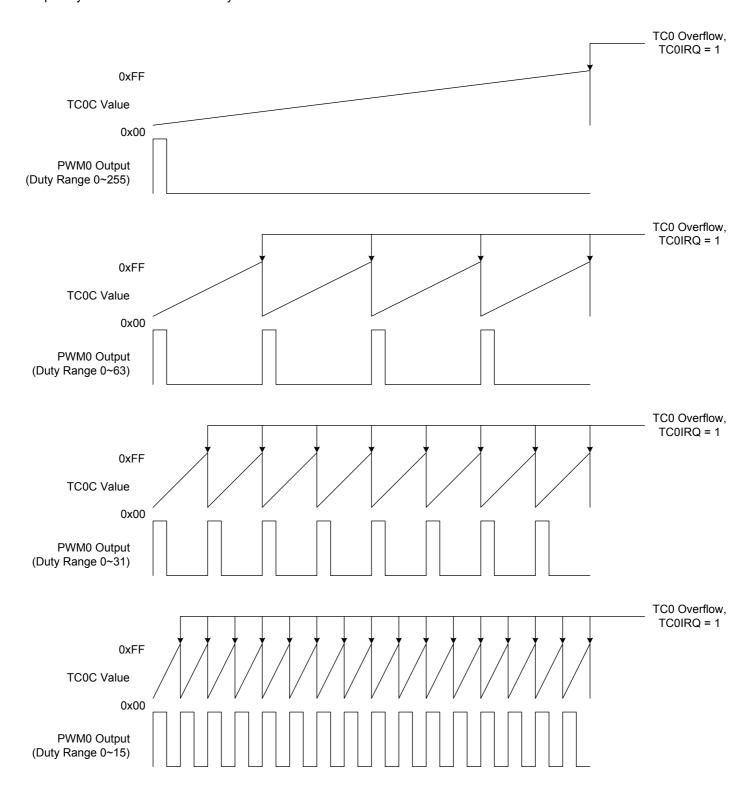

7.4.2 TCxIRQ and PWM Duty

15867339858

In PWM mode, the frequency of TC0IRQ is depended on PWM duty range. From following diagram, the TC0IRQ frequency is related with PWM duty.

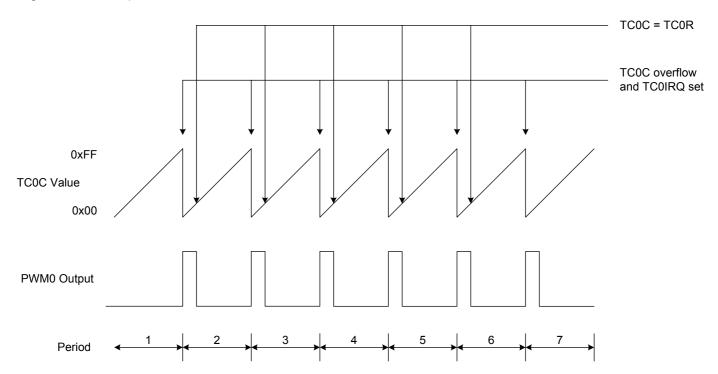

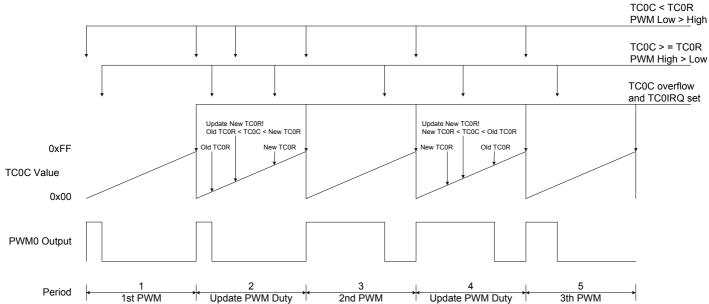

7.4.3 PWM Duty with TCxR Changing

15867339858

In PWM mode, the system will compare TC0C and TC0R all the time. When TC0C<TC0R, the PWM will output logic "High", when TC0C≧ TC0R, the PWM will output logic "Low". If TC0C is changed in certain period, the PWM duty will change in next PWM period. If TC0R is fixed all the time, the PWM waveform is also the same.

Above diagram is shown the waveform with fixed TC0R. In every TC0C overflow PWM output "High, when TC0C≧ TC0R PWM output "Low". If TC0R is changing in the program processing, the PWM waveform will became as following diagram.

In period 2 and period 4, new Duty (TC0R) is set. TC0 is double buffer design. The PWM still keeps the same duty in period 2 and period 4, and the new duty is changed in next period. By the way, system can avoid the PWM not changing or H/L changing twice in the same cycle and will prevent the unexpected or error operation.

7.4.4 PWM PROGRAM EXAMPLE

15867339858

Example: Setup PWM0 output from TC0 to PWM0OUT (P5.4). The external high-speed oscillator clock is 4MHz. Fcpu = Fosc/4. The duty of PWM is 30/256. The PWM frequency is about 1KHz. The PWM clock source is from external oscillator clock. TC0 rate is Fcpu/4. The TC0RATE2~TC0RATE1 = 110. TC0C = TC0R = 30.

MOV A,#01100000B

B0MOV TC0M,A ; Set the TC0 rate to Fcpu/4

MOV A,#30 ; Set the PWM duty to 30/256

B0MOV TC0C,A B0MOV TC0R,A

B0BCLR FTC0OUT ; Set duty range as 0/256~255/256.

B0BCLR FALOAD0

B0BSET FPWM0OUT ; Enable PWM0 output to P5.4 and disable P5.4 I/O function

BOBSET FTC0ENB ; Enable TC0 timer

Note: The TCOR is write-only register. Don't process them using INCMS, DECMS instructions.

> Example: Modify TC0R registers' value.

MOV A, #30H ; Input a number using B0MOV instruction. B0MOV TC0R, A

INCMS BUF0 ; Get the new TC0R value from the BUF0 buffer defined by

NOP ; programming.

B0MOV A, BUF0 B0MOV TC0R, A

Note: The PWM can work with interrupt request.

7.5 TIMER 1 (T1)

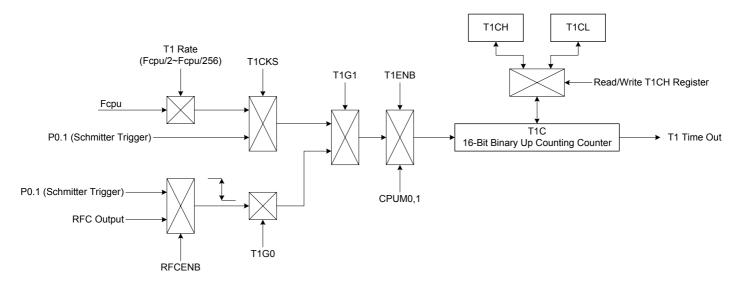

15867339858

7.5.1 OVERVIEW

The T1 is an 16-bit binary up timer and event counter. If T1 timer occurs an overflow (from FFFFH to 0000H), it will continue counting and issue a time-out signal to trigger T1 interrupt to request interrupt service.

The main purposes of the T1 timer is as following.

- 16-bit programmable up counting timer: Generates interrupts at specific time intervals based on the selected clock frequency.
- External event counter: Counts system "events" of external clock signals at the P0.1/T1IN input pin. The trigger edge is controlled by T1G1, T1G0 bits
- FC counter: Counts RFC's events of RFC clock signals at RFC output. The trigger edge is controlled by T1G0 bit. Please refer to "RFC DESCRIPTION".
- Input signal frequency measurement: In T1G1 = 0 of event counter and RFC mode, the input signal frequency from T1IN/RFC can be measure by sampling other timers (T0, TC0). Please refer to "RFC DESCRIPTION" about RCF mode application.
- Input signal plus width measurement: In T1G1 = 1 of event counter and RFC mode, the input signal high and low plus width from T1IN/RFC can be measure by T1CH, T1CH buffers. Please refer to "RFC DESCRIPTION" about RCF mode application.

T1 purpose control table.

T1 purpose	T1 clock source	T1CKS	RFCENB	T1G1	T1G0	Edge Direction
16-bit timer	Fcpu	0	0	0	-	-
16-bit event counter	P0.1/T1IN	1	0	0	0	Falling edge.
(P0.1 input frequency measurement)	P0.1/1111N	į			1	Rising edge.
P0.1 pulse width measurement	P0.1/T1IN	0	0	1	0	High pulse width measurement.
Fo.1 pulse width measurement			0		1	Low pulse width measurement.
RFC frequency measurement	RFC output	1	1	0	0	Falling edge.
KFC frequency frieasurement	KFC output	ı	ı,	U	1	Rising edge.
RFC pulse width measurement	DEC autout		1	1	0	High pulse width measurement.
KEC puise width measurement	RFC output	0	I	ı	1	Low pulse width measurement.

Note: In pulse width measurement mode, the T1CKS must be set as "0" by program.

7.5.2 T1M MODE REGISTER

15867339858

0A0H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
T1M	T1ENB	T1RATE2	T1RATE1	T1RATE0	T1CKS	-	T1IEN	T1IRQ
Read/Write	R/W	R/W	R/W	R/W	R/W	-	R/W	R/W
After reset	0	0	0	0	0	-	0	0

T1ENB: T1 counter control bit. Bit 7

0 = Disable T1 timer.

1 = Enable T1 timer.

T1RATE[2:0]: T1 timer internal clock select bits. Bit [6:4]

000 = fcpu/256.

001 = fcpu/128.

110 = fcpu/4.

111 = fcpu/2.

T1CKS: T1 timer clock source select bit. Bit 3

0 = Fcpu.

1 = External clock source from P0.1 when RFCENB=0, or RFC output when RFCENB=1.

Bit 1 T1IEN: T1 timer interrupt control bit.

0 = Disable T1 interrupt function.

1 = Enable T1 interrupt function.

T1IRQ: T1 timer interrupt request flag. Bit 0

0 = None T1 interrupt request.

1 = T1 interrupt request.

7.5.3 T1G1, T1G0 FLAGS

0BFH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
PEDGE	-	-	-	P00G1	P00G0	-	T1G1	T1G0
Read/Write	-	-	-	R/W	R/W	-	R/W	R/W
After reset	-	-	-	1	0	-	0	0

Bit 1 **T1G1:** T1 pulse width measurement control bit.

0 = Disable T1 pulse width measurement.

1 = Enable T1 pulse width measurement. T1CKS must be set as "0".

Bit 0 T1G0: T1 trigger direction select bit.

0 = Falling edge trigger (T1G1=0). High pulse width measurement (T1G1=1).

1 = Rising edge trigger (T1G1=0). Low pulse width measurement (T1G1=1).

7.5.4 T1CH, T1CL COUNTING REGISTER

15867339858

T1C is an 16-bit counter register for T1 interval time control. T1CH is high byte of T1C. T1CL is low byte of T1C.

0A1H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
T1CL	T1CL7	T1CL6	T1CL5	T1CL4	T1CL3	T1CL2	T1CL1	T1CL0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

0A2H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
T1CH	T1CH7	T1CH6	T1CH5	T1CH4	T1CH3	T1CH2	T1CH1	T1CH0
Read/Write	R/W							
After reset	0	0	0	0	0	0	0	0

The equation of T1C [T1CH, T1CL] initial value is as following.

T1C initial value = 65536 - (T1 interrupt interval time * input clock)

Example: To set 10ms interval time for T1 interrupt. High clock is external 4MHz. Fcpu=Fosc/4. Select T1RATE=010 (Fcpu/64).

The basic timer table interval time of T1.

T1RATE	T1CLOCK	High speed mode	(Fcpu = 4MHz / 4)	Low speed mode (Fcpu = 32768Hz / 4)	
TIIVATE	TICLOCK	Max overflow interval	One step = max/256	Max overflow interval	One step = max/256
000	Fcpu/256	16.777 s	256 us	2048 s	31250 us
001	Fcpu/128	8.388 s	128 us	1024 s	15625 us
010	Fcpu/64	4.194 s	64 us	512 s	7812.5 us
011	Fcpu/32	2.097 s	32 us	256 s	3906.25 us
100	Fcpu/16	1.048 s	16 us	128 s	1953.125 us
101	Fcpu/8	524.288 ms	8 us	64 s	976.563 us
110	Fcpu/4	262.144 ms	4 us	31 s	488.281 us
111	Fcpu/2	131.072 ms	2 us	16 s	244.141 us

The T1 16-bit counter buffer is T1CH and T1CL combination. System provides a routine to the same time. T1CH register is the key to control the T1 16-bit counter buffer processed through T1CH, T1CL buffers. Export T1C 16-bit buffer data to T1CH, T1CL registers is by reading T1CH register. Import T1C 16-bit buffer data from T1CH, T1CL registers is by writing T1CH register data.

Example: Reading T1C 16-bit buffer data is controlled by reading T1CH register. Read T1CH register data and low byte data of T1C 16-bit buffer exporting to T1CL register at the same time.

B0MOV A, T1CH ; Read T1CH first and T1C low byte data exported to T1CL.

B0MOV A, T1CL ; Read T1CL data from buffer.

...

Note: Read T1CH first when reading T1C 16-bit buffer.

Example: Writing and setting T1C 16-bit buffer data is controlled by writing data into T1CH register. When writing T1CH register data, T1CH, T1CL data are imported into T1C 16-bit buffer at the same time. Setting T1CL register data first is necessary, or the T1C low byte data would be error.

B0MOV T1CL, A ; Write T1CL data into T1CL buffer first.

B0MOV T1CH, A ; Write T1CH data and T1CH, T1CL are imported to T1C

; 16-bit buffer.

Note: Write T1CL first when writing T1C 16-bit buffer.

Example: Write T1CL is by write T1CH. Only executing "CLR T1CL" and no do any T1CH writing operation can't clear T1CL buffer. Clear T1CL must be using "MOV" instruction as following.

MOV A, #0
B0MOV T1CL, A ; Write "0" into T1CL to clear T1CL.

B0MOV T1CH, A ; Write T1CH data and T1CH, T1CL are imported to T1C

: 16-bit buffer.

Note: Don't clear T1CL by "CLR" instruction.

7.5.5 T1 TIMER OPERATION SEQUENCE

15867339858

T1 timer operation sequence of setup T1 timer is as following.

Stop T1 timer counting, disable T1 interrupt function and clear T1 interrupt request flag.

B0BCLR FT1ENB ; T1 timer.

B0BCLR FT1IEN ; T1 interrupt function is disabled. B0BCLR FT1IRQ ; T1 interrupt request flag is cleared.

Set T1 timer rate.

or

or

MOV A, #0xxx0000b ;The T1 rate control bits exist in bit4~bit6 of T1M. The

; value is from x000xxxxb~x111xxxxb.

B0MOV T1M,A ; T1 timer is disabled.

Set T1 clock source from internal clock source (Fcpu), external clock source (P0.1/T1IN), or RFC.

BOBCLR FT1CKS ; Select T1 internal clock source.

or

B0BSET FT1CKS ; Select T1 external clock source.

B0BSET FRFCENB ; Select T1 RFC clock source.

Set T1 interrupt interval time.

MOV A,#7FH

B0MOV T1CL,A ; Set T1CL value.

MOV A,#7FH

B0MOV T1CH,A ; Set T1CH value.

Set T1 timer function mode.

BOBSET FT1IEN ; Enable T1 interrupt function.

B0BSET FT1G1 ; Enable T1 pulse width measurement.

Enable T1 timer.

B0BSET FT1ENB ; Enable T1 timer.

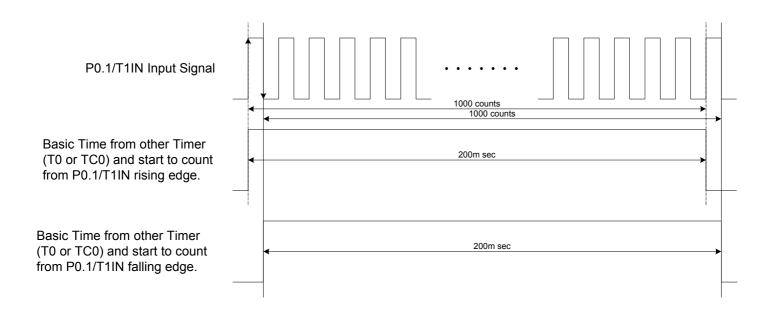

7.5.6 T1IN INPUT FREUQENCY MEASUREMENT

15867339858

T1 is a 16-bit timer/counter. The 16-bit counter buffer (T1CH, T1CL) is long enough to measure high-speed signal's frequency from P0.1/T1IN input. For P0.1/T1IN input frequency measurement, T1 counts input signal clock number and using other timer (T0 to TC0) to generate one period time to be the basic time to calculate input frequency. When the period time is time out, disable T1 counter and the number of P0.1/T1IN input clock is stored in T1CH and T1CL registers. Using the basic time to divide by input clock number and get the one cycle period. The reciprocal of one cycle period is the input signal's frequency from P0.1/T1IN (F=1/T). If the T1CH, T1CL = 0x1388 = 5000 and the basic time 50m sec, the input frequency is 100KHz. Input frequency = 1/(50ms/5000) = 100KHz

- T1 clock source is event counter input (P0.1/T1IN).
- T0 or TC0 clock source is internal clock (Fcpu).

Example: Using T0 to measure P0.1/T1IN input 100KHz frequency. The basic in the deneral policy 50ms. Fhosc=4MHz, Fcpu=Fhosc/4=1mips. The P0.1/T1IN input trigger is rising edge.

; Set T1 mode.

CLR T1M ; Clear T1M register.

MOV A, #0 B0MOV T1CL, A

B0MOV T1CH, A ; Clear T1 counter buffers.

BOBSET FT1CKS ; Set T1 to event counter mode.

B0BSET FT1G0 ; Event counter input trigger is rising edge.

B0BCLR FT1IRQ ; Clear T1 interrupt request flag.

; Set T0 mode.

B0BCLR T0ENB ; Disable T0 timer.

B0BCLR T0IEN ; Disable T0 interrupt function.
B0BCLR T0IRQ ; Disable T0 interrupt request flag.

MOV A, #00h

B0MOV T0M, A ; Set T0 rate is Fcpu/256.

MOV A, #61

B0MOV T0C, A ; Set T0 interval time to 50ms.

; Start to measure P0.1/T1IN input frequency.

Chk_1st_Eg:

B0BTS1 P0.1 ; Check P0.1 rising edge.

JMP Chk_1st_Eg

BOBSET FT1ENB ; Enable T1 counter. BOBSET FT0ENB ; Enable T0 timer.

Chk 50ms:

B0BTS1 FT0IRQ ; Check T0 50 ms time out.

JMP Chk 50ms

BOBCLR FT1ENB ; Stop T1 counter.

Cal_Freq: ; Calculate P0.1/T1IN input frequency from T1CH, T1CL.

B0MOV A, T1CH ; T1CH = 13H

B0MOV A, T1CL ; T1CL = 88H

...

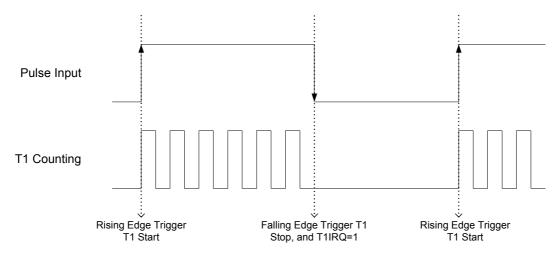

7.5.7 T1IN INPUT PULSE WIDTH MEASUREMENT

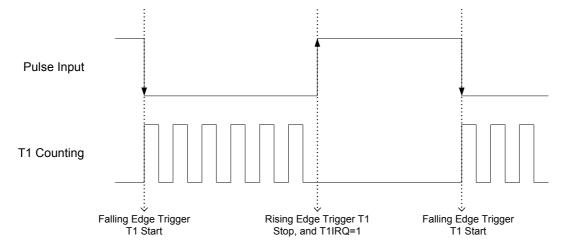

15867339858

T1 builds in pulse width measurement function and controlled by T1G1 bit of PEDGE register. T1G1=0, disable pulse width measurement. T1G1=1, enable pulse width measurement. The input signal is from P0.0/T1IN or RFC. Please refer to "RFC DESCRIPTION" for RFC pulse width measurement. The section explains the pulse width measurement of P0.1/T1IN. The pulse includes high and low directions and controlled by T1G0 bit of PEDGE register. The time base of pulse width measurement is T1 and the clock source is from internal clock (Fcpu). T1IRQ=0, T1 starts to count when trigger occurrence. T1IRQ=1, T1 stops counting and T1CH, T1CL data are latched. T1IRQ is cleared by program and T1 starts to count automatically. The T1CH, T1CL dumped by program is during T1 stopping period, or T1 is counting and the T1C data is counted.

• T1G1, T1G0=10: Enable high pulse width measurement. Rising edge trigger starts T1 to count and falling edge stops T1 counting.

 T1G1, T1G0=11: Enable low pulse width measurement. Falling edge trigger starts T1 to count and rising edge stops T1 counting.

Example: Measure 50Hz clock input pulse width from P0.1/T1IN pin using T1 pulse (lock) measure flowers. Fhosc=4MHz, Fcpu=Fhosc/4=1mips. T1 base time is 256us. Pulse width is T1C buffer * T1 base time. T1CH, T1CL = 0x0027=39, Pulse width = 256us*39 = 9.9ms. (Pulse width of 50Hz signal is 10ms)

High Pulse Width Measurement.

; Set T1 mode.

CLR T1M ; Clear T1M register and set T1 rate is Fcpu/256.

MOV A, #0 B0MOV T1CL, A

B0MOV T1CH, A ; Clear T1 counter buffers.

B0BSET FT1G1 ; Enable pulse width measurement.
B0BCLR FT1G0 ; Select high pulse direction.
B0BCLR FT1IRQ ; Clear T1 interrupt request flag.

BOBSET FT1ENB : Enable T1 timer.

; Check T1IRQ=1.

Chk T1IRQ:

B0BTS1 FT1IRQ ; Check T1IRQ=1.

JMP Chk_T1IRQ

B0MOV A, T1CH ; Pulse width measure end.

; T1CH=00h

15867339858

RESISTANCE TO FREQUENCY CONVERTER (RFC)

8.1 OVERVIEW

The MCU builds in resistance to frequency converter (RFC) CR type oscillation converter. The RFC conversion circuit is connecting a resistive sensor, reference resistance and a capacitor. Resistance value of the resistive sensor or reference resistance connected to the RFC channel input is converted into frequency by CR oscillator and the number of clocks is counted in the built-in measurement timer/counter (T1). Reading the value of T1 measurement obtains the digitally converting value detected by the resistance. Various sensor circuits such as temperature measurement using a thermistor can easily realize using the RFC. The RFC includes three channels. One channel is used reference channel, and the other two are sensor input channels. For different resistive sensor, the RFC clock frequency is different. T1 provides pulse width measurement and input frequency measurement functions to measure high/low speed RFC clock. RFC pin is shared with port 5. When RFCENB = 1, P5.0~P5.2, P5.3 are selected to RFC0~RFC2, RFCI. P5.5 is shared with RFCOUT controlled by RFCOUT bit of RFC register.

8.2 RFCM REGISTER

15867339858

0A3H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
RFCM	RFCOUT	-	ı	-	ı	RFCH1	RFCH0	RFCENB
Read/Write	R/W	-	-	-	-	R/W	R/W	R/W
After reset	0	-	-	-	-	0	0	0

Bit 7 **RFCOUT:** RFC output control bit.

0 = Disable RFC output, P5.5 is general purpose I/O.

1 = Enable RFC output, P5.5 is RFCOUT pin.

Bit[2:1] RFCH[2:1]: RFC input channels select bit.

RFCH[2:1]	RFC Channel	Description
00	RCF Channel 0 (P5.0)	Enable RFC channel 0 (P5.0) and set P5.1, P5.2 as analog input to avoid extra
		power consumption.
01	RCF Channel 1 (P5.1)	Enable RFC channel 1 (P5.1) and set P5.0, P5.2 as analog input to avoid extra
		power consumption.
10	RCF Channel 2 (P5.2)	Enable RFC channel 2 (P5.2) and set P5.0, P5.1 as analog input to avoid extra
		power consumption.
11	Reserved	-

Bit 0 **RFCENB:** RFC control bit.

0 = Disable RFC function.

1 = Enable RFC function.

* Note:

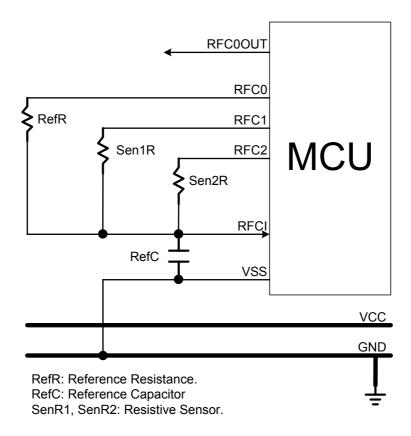

- 1. If RFCENB=1 then P5.0 is RFC0, P5.1 is RFC1, P5.2 is RFC2 and P5.3 is RFCI.
- 2. If RFCOUT=1 then P5.5 is RFCOUT.
- 3. Before RFC enable, P5.0~P5.3 must be set as input mode without pull-up resistor first by program.

15867339858

8.3 RFC CIRCUIT

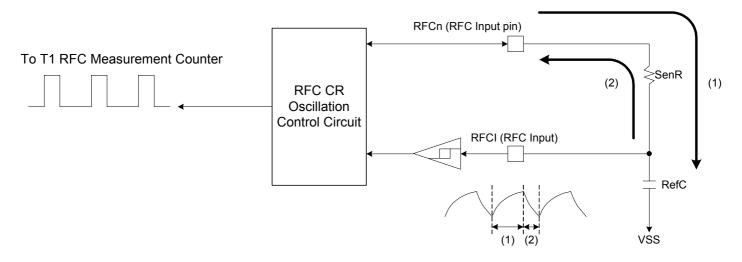

RFC can configure with a reference resistance and two sensors. The connection diagram is as following. The RFC circuit supports two resistive sensor inputs and one reference resistance. One terminal of resistance is connected to RFC channel input, and the other is connected to RFCI pin. The capacitor of RFC circuit is commonly used for the reference resistance and resistive sensors, and connected between RFCI pin and VSS of MCU. These resistances are switched by RFCH[1:0] bits of RFC register. RFCH[1:0] = 00, RFC input selects to RFC0 pin (P5.0). RFCH[1:0] = 01, RFC input selects to RFC1 pin (P5.1). RFCH[1:0] = 10, RFC input selects to RFC2 pin (P5.2). One RFC input is selected, the other pins stay in analog input status to avoid extra power consumption. RFC digitally converting clock is output from RFCOUT pin (P5.5) controlled by RFCOUT bit of RFC register.

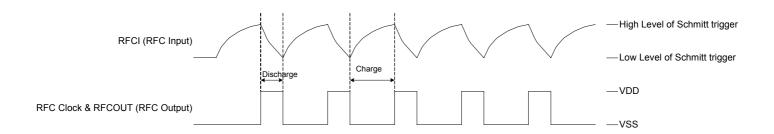

8.4 RFC OPERATION

15867339858

RFC operation is base on charge and discharge capacitor to obtain the converting clock. RFCI (RFC input pin) is Schmitt trigger structure. The RFCENB=1 turns on RFC function. RFCn (RFC channel pin RFCH[2:0]) charges and discharges the reference capacitor. Loop (1) of above figure is charge mode. The capacitor is charged by RFCn, and the voltage level into RFCI increases. RFCI detects the voltage level to Schmitt trigger high-level voltage, and then RFCn switches to discharge mode. Loop (2) is discharge mode. RFCn discharges the capacitor and the voltage level starts to fall down. RFCI detects the voltage level to Schmitt trigger low-level voltage, and then RFCn switches to charge mode. The result of charge and discharge switching is converted by CR oscillation control circuit and generate digitally clock.

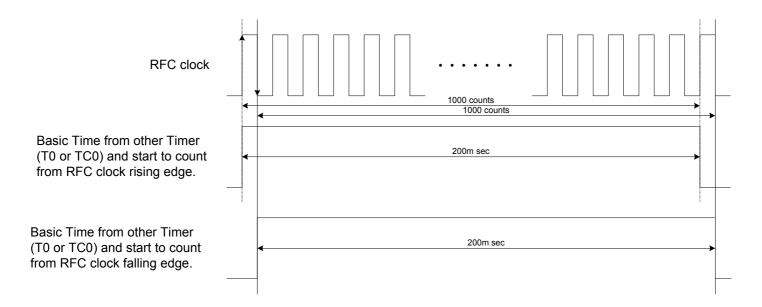

The reference capacitor value is steady. The RFC clock frequency value depends on resistance value and determines charge and discharge rate. Using the RFC clocks of reference resistance and resistive sensor can measure the sensor resistance by the frequency of RFC converting result. The RFC clock can be T1 clock source to measure RFC converting value by frequency measurement and pulse width measurement. The RFC clock also can output to RFCOUT pin (P5.5) when RFCOUT =1.

8.4.1 RFC FREUQENCY MEASUREMENT

15867339858

RFC frequency measurement supports high speed RFC frequency by T1 16-bit timer/counter. T1 is in event counter mode and the clock source is RFC clock. T1 counts RFC clock number and using other timer (T0 to TC0) to generate one period time to be the basic time to calculate RFC frequency. When the period time is time out, disable T1 counter and the number of RFC clock is stored in T1CH and T1CL registers. Using the basic time to divide by RFC clock number and get the one cycle period. The reciprocal of one cycle period is the input signal's frequency from RFC (F=1/T). If the T1CH, T1CL = 0x1388 = 5000 and the basic time 50m sec, the RFC frequency = 1/(50ms/5000) = 100KHz

Example: Using T0 to measure RFC 100KHz frequency from RFC0. The basic time generated by T0 is 50ms. Fhosc=4MHz, Fcpu=Fhosc/4=1mips. The RFC clock trigger is rising edge.

8.4.2 RFC PULSE WIDTH MEASUREMENT

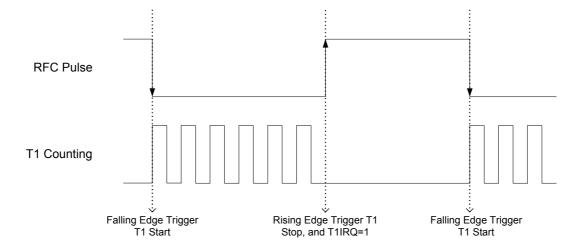

15867339858

RFC pulse width measurement supports low speed RFC clock using T1 pulse width measurement function. T1 input signal is from RFC when RFCENB=1. The pulse includes high and low directions and controlled by T1G0 bit of PEDGE register. The time base of pulse width measurement is T1 and the clock source is from internal clock (Fcpu). T1IRQ=0, T1 starts to count when trigger occurrence. T1IRQ=1, T1 stops counting and T1CH, T1CL data are latched. T1IRQ is cleared by program and T1 starts to count automatically. The T1CH, T1CL dumped by program is during T1 stopping period, or T1 is counting and the T1C data is counted.

 T1G1, T1G0=10: Enable high pulse width measurement. Rising edge trigger starts T1 to count and falling edge stops T1 counting.

• T1G1, T1G0=11: Enable low pulse width measurement. Falling edge trigger starts T1 to count and rising edge stops T1 counting.

Example: Measure 50Hz RFC clock input pulse width using T1 pulse width measure for the property of the pulse width using T1 pulse width measure for the property of the pulse width is T1C buffer * T1 base time. T1CH, T1CL = 0x0027=39, Pulse width = 256us*39 = 9.9ms. (Pulse width of 50Hz signal is 10ms)

8.5 RFC FIRST PULSE WIDTH MEASUREMENT

Measure the first pulse width is general application. Use P5.3 to charge RC until the capacitor voltage reaching VDD first. Then enable RFC function to discharge the capacitor electric charge and T1 starts to count. When the voltage drops to Schmitt-trigger low level, T1 stops and the T1 counting buffer value (T1CH, T1CL) is the pulse width. The first pulse width measurement of RFC is for high impedance resistive sensor application.

The P5.3 outputs high to charge the capacitor voltage to VDD. The RFC trigger edge initial status is low. When RFC enables (RFCENB=1), P5.3 becomes RFCI input pin. The system detects the first rising edge from the RFC trigger initial status to the capacitor high voltage and starts T1 counting. RFC channel discharges the capacitor and the voltage is dropping. The discharge voltage is from VDD to Schmitt-trigger low level. T1 stops when system detects RFCI input voltage equal to the low level of Schmitt-trigger. Reading T1CH and T1CL value by program and calculate the period of the pulse width. The First width length is longer than normal RFC pulse width length, because the discharge is from VDD to Schmitt-trigger low level. The normal RFC discharge is from Schmitt-trigger high level to low level.

Note: The RFC first pulse width measurement only supports T1 high pulse width measurement.

Example: Measure RFC first high pulse width using T1 pulse width measuremy. The scenario Figure 1. The scenario Fi

4x32 LCD DRIVER

15867339858

9.1 OVERVIEW

The MCU builds in 4x32 (4 commons and 32 segments, 128 dots) LCD driver. The LCD supports 1/4 duty and 1/2, 1/3 bias LCD panel. The LCD frame rate is 64Hz and clock source is external 32768Hz oscillator crystal or RC type. LCD includes R type and C type (1/3 bias only) structures. R type is using external bias circuit to adjust LCD power and bias voltage. C type is using internal charge pump to adjust LCD power and bias voltage.

Basic C type LCD Circuit

15867339858

9.2 LCD REGISTERS

0CBH	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
LCDM	-	-	-	-	RCLK	P3SEG	BIAS	LCDENB
Read/Write	-	-	-	-	R/W	R/W	R/W	R/W
After reset	-	-	-	-	0	0	0	0

Bit 3 RCLK: External low speed clock type selection bit.

0 = 32768Hz crystal/ceramic type connected to LXIN, LXOUT pins.

1 = RC type.

Bit 2 **P3SEG:** Seg24~Seg31 shared with P3.0~P3.7 control bit.

0 = Enable Seg24~Seg 31 pins. 1 = Enable P3.0~P3.7 pins.

Bit 1 BIAS: LCD bias control bit.

0 = 1/3 bias (C type and R type).

1 = 1/2 bias (R type only).

Bit 0 LCDENB: LCD control bit.

0 = Disable. 1 = Enable.

Note: Segment 24~Segment 31 pins are shared with P3.0~P3.7. When these pins are used as Port3 general purpose I/O mode, the P3SEG bit of LCDM register must be set as "1".

089H	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	5 kg/3	39855
VLCD	-	-	CPCK1	CPCK0	VLCD2	VLCD1	VLCD0	VLCDCP
Read/Write	-	-	R/W	R/W	R/W	R/W	R/W	R/W
After reset	-	-	0	0	0	0	0	0

Bit [5:4] **CPCK[1:0]:** VLCD charge-pump clock selection.

CPCK[1:0]	Charge-pump Clock
00	32KHz
01	16KHz
10	4KHz
11	1KHz

Note:

- 1. In general speaking, 1KHz charge-pump clock is enough for most application.
- 2. Lower charge-pump clock frequency can save more power consumption. Higher charge-pump clock frequency can provide stronger VLCD driving capability.

Bit [3:1] **VLCD[2:0]:** VLCD charge-pump voltage selection.

VLCD[2:0]	Charge-pump Output Voltage		
000	0.9V		
001	1.0V		
010	1.1V		
011	1.2V		
100	1.3V		
101	1.4V		
110	1.5V		
111	1.6V		

Bit 0 **VLCDCP:** VLCD charge-pump control bit.

0 = Disable.

1 = Enable.

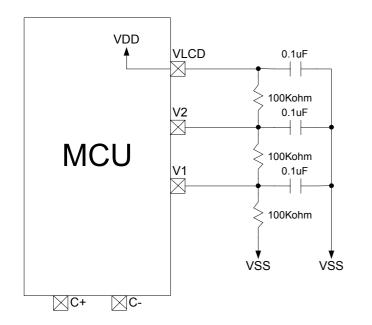

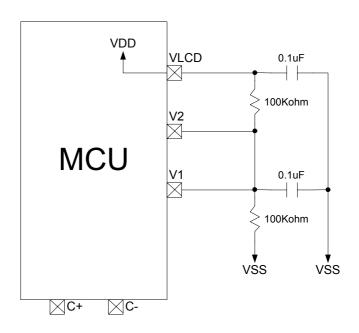

15867339858

9.3 R-TYPE LCD MODE

In R-type mode, LCD power (VLCD) is connected with internal VDD. V1, V2 bias voltage is controlled by external resistor. The bias resistors determine LCD V1, V2 bias voltage and LCD driver current. Too much current makes LCD panel to bring remnant images. In normal condition, the suggestion of the external bias resistor's value is 100Kohm. In R-type LCD mode, the VLCDCP bit of VLCD register must be "0".

LCD Bias	VLCD	V2	V1
1/3 Bias (Bias=0)	VDD	2/3*VDD	1/3*VDD
1/2 Bias (Bias=1)	VDD	1/2*VDD	1/2*VDD

1/3 bias, 1/4 duty, R-type LCD Circuit.

1/2 bias, 1/4 duty, R-type LCD Circuit.

- Note:
- 3. In R-type mode, C+/C- don't connect any devices.
- 4. VLCD is internal VDD in R-type mode.
- 5. 1/2 bias, V2 connects to V1.
- 6. The 0.1uF capacitors of VLCD/V1/V2 pins are necessary for power stable.
- Example : Set R-type LCD mode.

; Switch LCD mode to R-type mode.

B0BCLR FVLCDCP ; Disable LCD charge-pump and LCD is switched to ; R-type mode.

; Set LCD 32768Hz clock source type.

B0BCLR FRCLK ; Crystal/ceramic type.

or B0BSET FRCLK ; RC type.

; Set LCD Bias. ; RC type.

B0BCLR FBIAS ; 1/3 bias. or

BOBSET FBIAS ; 1/2 bias. ; Enable LCD.

BOBSET FLCDENB ; Enable LCD driver...

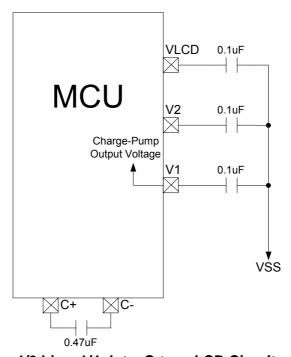

9.4 C-TYPE LCD MODE

In C-type mode only support 1/3 bias LCD panel. The LCD power (VLCD) is supplied by internal charge-pump. The power consumption of C-type mode is less than R-type, because no external DC bias circuit expenses power current. The charge-pump voltage level is controlled by VLCD[2:1] bits of VLCD register. V1 voltage is the charge-pump output voltage, and charge-pump output voltage measurement is from V1 pin. In C-type LCD mode, the VLCDCP bit of VLCD register must be "1".

VLCD[2:0]	Charge-pump	V1	V2	VLCD
VLCD[2.0]	Voltage	1/3 BIAS	1/3 BIAS=2xV1	1/3 BIAS=3xV1
000	0.95V	0.95V	1.9V	2.85V
001	1.05V	1.05V	2.1V	3.15V
010	1.15V	1.15V	2.3V	3.45V
011	1.25V	1.25V	2.5V	3.75V
100	1.35V	1.35V	2.7V	4.05V
101	1.45V	1.45V	2.9V	4.35V
110	1.55V	1.55V	3.1V	4.65V
111	1.65V	1.65V	3.3V	4.95V

NOTE: VDD=5V \ temperature=25°C \ error=-10%~+10%

1/3 bias, 1/4 duty, C-type LCD Circuit.

* Note:

- 1. In C-type mode only support 1/3 bias
- 2. In C-type mode, connect a 0.1uF or 0.47uF capacitor between C+ and C- pins. Users can adjust the capacitor value depend on the LCD panel size.
- 3. V1 voltage is charge-pump output voltage.
- 4. The 0.1uF capacitors of VLCD/V1/V2 pins are necessary for power stable. Users can adjust the capacitor value depend on the LCD panel size.

Example : Set C-type LCD mode.

12 DEVELOPMENT TOOL VERSION

12.1 ICE (In Circuit Emulation)

- SN8ICE 2K ICE: Full function emulates SN8P2308.
- * SN8ICE 2K ICE emulation notice:
 - a. Operation voltage of ICE: 3.0V ~ 5.0V.
 - b. Recommend maximum emulation speed at 5V: 8 MIPS (e.g. 16Mhz Crystal and Fcpu = Fhosc/2).
 - c. Use SN8P2308 EV-KIT to emulate LVD, LCD and RFC.
- Note: S8KD-2 ICE doesn't support SN8P2308 emulation.

12.2 OTP WRITER

- **Easy Writer V1.0:** OTP programming is controlled by ICE without firmware upgrade suffers. Please refer easy writer user manual for detailed information.
- MP-Easy Writer V1.0: Stand-alone operation to support SN8P2308 mass production.
- Writer V3.0: Stand-alone operation to support SN8P2308 mass production.

12.3 IDE

SONiX 8-bit MCU integrated development environment include Assembler, ICE debugger and OTP writer software.

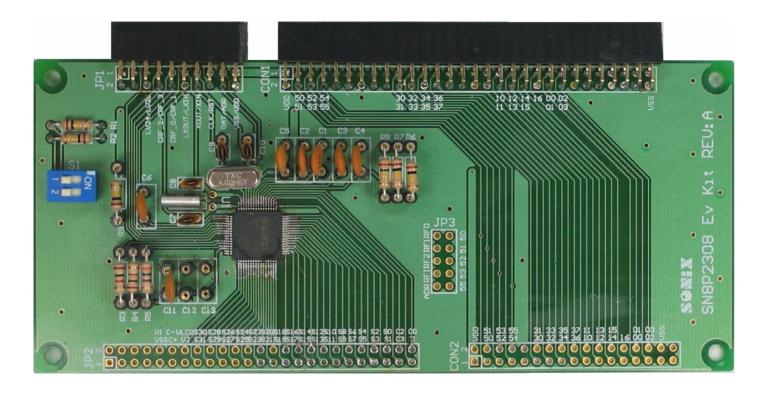

- M2IDE V107 or later.
 - Support SN8ICE_2K ICE
 - Support Assembly and ICE debug function
 - Support Easy Writer and MP-Easy Writer
- Note: SN8IDE_1.99X don't support SN8P2308 emulation.

12.4 SN8P2308 EV KIT 12.4.1 PCB DESCRIPTION

15867339858

SONIX provides SN8P308 EV Kit for function emulation. For SN8P2308 ICE emulation, the EV kit provides RFC, LCD and LVD 2.4V/3.6V selection circuits.

CON1: I/O port. Connect to SN8ICE 2K CON1.

CON2: I/O port. Connect to target board.

JP1: LVD 2.4V, 3.6V input pins, LCD and RFC control pins. Connect to SN8ICE 2K JP6.

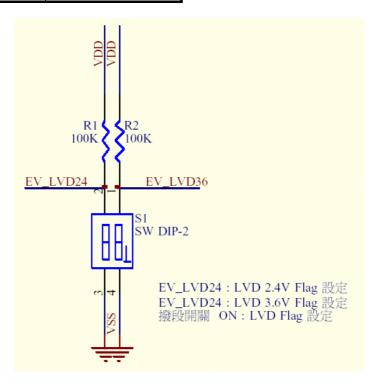

JP2: LCD COM0~COM3, SEG0~SEG31 output pins. Connect to LCD panel.

JP3: Connect the P5.0 ~ P53 of CON2 with RF0 ~ RFI of SN8P2308 EV chip.

C6, R9: SN8P2308 EV chip reset circuit. C6=0,1uF, R9=100K ohm.

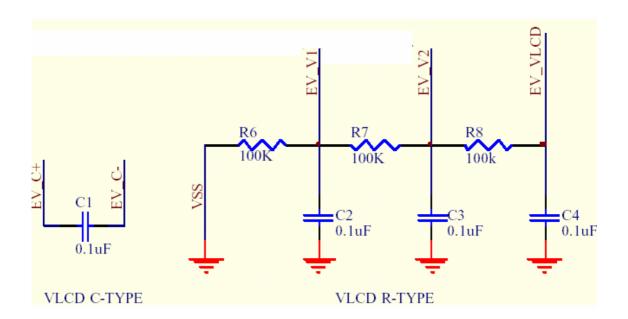

Switch No.	On	Off
1	LVD 2.4V Active	LVD 2.4V Inactive
2	LVD 3.6V Active	LVD 3.6V Inactive

C1~C4, R6~R8: LCD circuit devices. Please refer LCD section to adjust circuit for different LCD modes.

Note: Set port 3 as input mode (P3M = "0") if LCD segment 24 ~ segment 31 is enabled (P3SEG = "0").

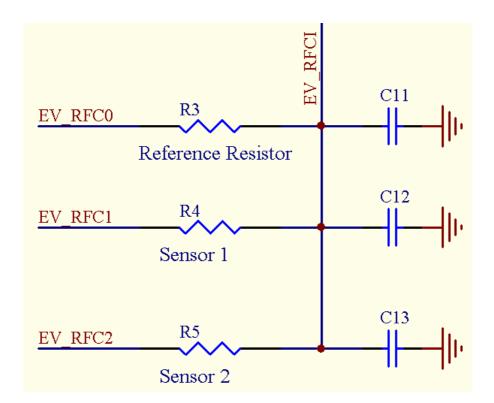

RFC circuit emulation:

15867339858

- R3: RFC channel 0 for "Reference Resister"
- R4: RFC channel 1 for "sensor 1" R5: RFC channel 2 for "sensor 2"
- C11 ~ C13: Put a Capacitor for RFC oscillator circuit
- Short JP3 can connect the RF0, RF1, RF2 and RFI of SN8P2308 EV-Chip to CON2 for target board.
- Disable Port 5 pull-up in RFC circuit emulation

12.4.2 SN8P2308 EV KIT CONNECT TO SN8ICE 2K

15867339858

The connection from SN8P2308 EV KIT to SN8ICE 2K is as following.

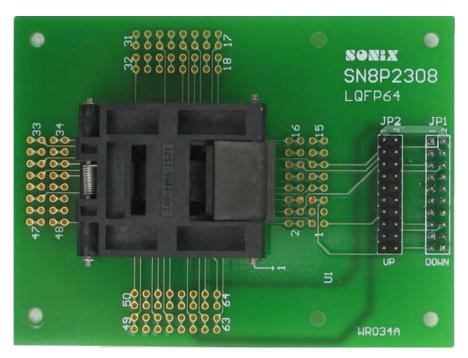

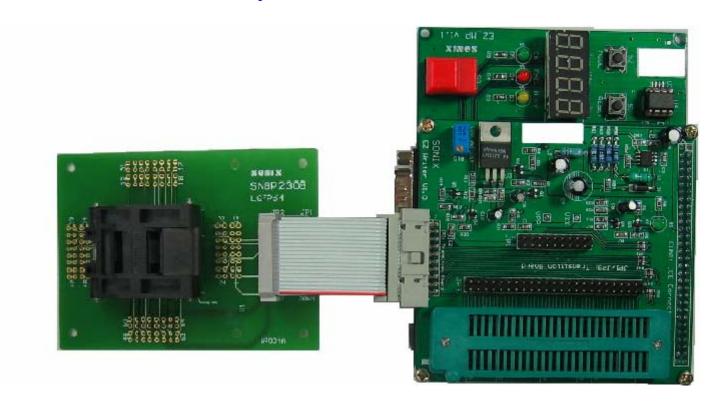

12.5 TRANSITION BOARD FOR OTP PROGRAMMING 15867339858 12.5.1 SN8P2308 TRANSITION BOARD

SN8P2308 transition board is for SN8P2308 OTP programming by LQFP 64 pin socket connection.

- JP1/JP2: Connect to EZ writer, EZ_MP writer or writer V3.0.
- U1: LQFP 64 pin socket.

12.5.2 CONNECT TO MP-Easy WRITER

12.5.3 CONNECT TO Easy WRITER

Note: Connect Easy Writer to ICE must be through an 60-pin cable
